

Description

BIOINFORMATICALLY DETECTABLE GROUP OF NOVEL VACCINIA REGULATORY GENES AND USES THEREOF

BACKGROUND OF INVENTION

CONTINUATION STATEMENT

[0001] This application is a continuation of U.S Patent Application Serial No. 10604943, filed 28-Aug-03, entitled "Bioinformatically Detectable Group of Novel Vaccinia Regulatory Genes and Uses of Thereof", and is a continuation of U.S Provisional Patent Application Serial No. 60441241, filed 17-Jan-03, entitled "Bioinformatically Detectable Group of Novel Vaccinia Regulatory Genes and Uses of Thereof ", and is a continuation in part of U.S Patent Application Serial No. 10604942, filed 27-Aug-03, entitled "Bioinformatically Detectable Group of Novel Viral Regulatory Genes and Uses of Thereof", and is a continuation in part of U.S Patent Application Serial No. 10604945, filed 27-Aug-03,

entitled "Bioinformatically Detectable Group of Novel Viral Regulatory Genes and Uses of Thereof ", and is a continuation in part of U.S Provisional Patent Application Serial No. 60457788, filed 27-Mar-03, entitled " Bioinformatically Detectable Group of Novel Viral Regulatory Genes and Uses of Thereof ", and is a continuation in part of U.S Provisional Patent Application Serial No. 60411230, filed 17-Jan-03, entitled "Bioinformatically Detectable Group of Novel HIV Regulatory Genes and Uses of Thereof ", and is a continuation in part of U.S Patent Application Serial No. 10310188, filed 5-Dec-02, entitled "Bioinformatically Detectable Group of Novel Viral Regulatory Genes and Uses of Thereof ", and is a continuation in part of U.S Patent Application Serial No. 10303778, filed 26-Nov-02, entitled "Bioinformatically Detectable Group of Novel Viral Regulatory Genes and Uses of Thereof", and is a continuation in part of U.S Patent Application Serial No. 10604944, filed 28-Aug-03, entitled "Bioinformatically Detectable Group of Novel HIV Regulatory Genes and Uses of Thereof ", and is a continuation in part of U.S Patent Application Serial No. 10604984, filed 29-Aug-03, entitled "Bioinformatically Detectable Group of Novel Viral Regulatory Genes and Uses of Thereof", and is a continuation in part

of U.S Patent Application Serial No. 10605838, filed 30-Oct-03, entitled "Bioinformatically Detectable Group of Novel HIV Regulatory Genes and Uses of Thereof", the disclosures of which applications are all hereby incorporated by reference and claims priority therefrom.

FIELD OF THE INVENTION

[0002] The present invention relates to a group of bioinformatically detectable novel viral RNA regulatory genes, here identified as "viral genomic address messenger" or "VGAM" genes.

DESCRIPTION OF PRIOR ART

[0003] Small RNAs are known to perform diverse cellular functions, including post-transcriptional gene expression regulation. The first two such RNA genes, Lin-4 and Let-7, were identified by genetic analysis of *Caenorhabditis Elegans* (*Elegans*) developmental timing, and were termed short temporal RNA (stRNA) (Wightman, B., Ha, I., Ruvkun, G., *Cell* 75, 855 (1993); Erdmann, V.A. et al., *Nucleic Acids Res.* 29, 189 (2001); Lee, R. C., Feinbaum, R. L., Ambros, V., *Cell* 75, 843 (1993); Reinhart, B. et al., *Nature* 403, 901 (2000)).

[0004] Lin-4 and Let-7 each transcribe a ~22 nucleotide (nt)

RNA, which acts a post transcriptional repressor of target mRNAs, by binding to elements in the 3"-untranslated region (UTR) of these target mRNAs, which are complimentary to the 22 nt sequence of Lin-4 and Let-7 respectively. While Lin-4 and Let-7 are expressed at different developmental stage, first larval stage and fourth larval stage respectively, both specify the temporal progression of cell fates, by triggering post-transcriptional control over other genes (Wightman, B., Ha, I., Ruvkun, G., Cell 75, 855 (1993); Slack et al., Mol.Cell 5 ,659 (2000)). Let-7 as well as its temporal regulation have been demonstrated to be conserved in all major groups of bilaterally symmetrical animals, from nematodes, through flies to humans (Pasquinelli, A., et al. Nature 408 ,86 (2000)).

[0005] The initial transcription product of Lin-4 and Let-7 is a ~60-80nt RNA, the nucleotide sequence of the first half of which is partially complimentary to that of its second half, therefore allowing this RNA to fold onto itself, forming a "hairpin structure". The final gene product is a ~22nt RNA, which is "diced" from the above mentioned "hairpin structure", by an enzyme called Dicer, which also apparently also mediates the complimentary binding of this ~22nt segment to a binding site in the 3" UTR of its target gene.

[0006] Recent studies have uncovered 93 new genes in this class, now referred to as micro RNA or miRNA genes, in genomes of *Elegans*, *Drosophila*, and Human (Lagos-Quintana, M., Rauhut, R., Lendeckel, W., Tuschl, T., Science 294 ,853 (2001); Lau, N.C., Lim, L.P., Weinstein, E.G., Bartel, D.P., Science 294 ,858 (2001); Lee, R.C., Ambros, V., Science 294 ,862 (2001). Like the well studied Lin-4 and Let-7, all newly found MIR genes produce a ~60–80nt RNA having a nucleotide sequence capable of forming a "hairpin structure". Expressions of the precursor ~60–80nt RNA and of the resulting diced ~22nt RNA of most of these newly discovered MIR genes have been detected.

[0007] Based on the striking homology of the newly discovered MIR genes to their well-studied predecessors Lin-4 and Let-7, the new MIR genes are believed to have a similar basic function as that of Lin-4 and Let-7: modulation of target genes by complementary binding to the UTR of these target genes, with special emphasis on modulation of developmental control processes. This is despite the fact that the above mentioned recent studies did not find target genes to which the newly discovered MIR genes complementarily bind. While existing evidence suggests

that the number of regulatory RNA genes "may turn out to be very large, numbering in the hundreds or even thousands in each genome", detecting such genes is challenging (Ruvkun G., "Perspective: Glimpses of a tiny RNA world", Science 294 ,779 (2001)).

[0008] The ability to detect novel RNA genes is limited by the methodologies used to detect such genes. All RNA genes identified so far either present a visibly discernable whole body phenotype, as do Lin-4 and Let-7 (Wightman et. al., Cell 75, 855 (1993); Reinhart et al., Nature 403, 901 (2000)), or produce significant enough quantities of RNA so as to be detected by the standard biochemical genomic techniques, as do the 93 recently detected miRNA genes. Since a limited number clones were sequenced by the researchers discovering these genes, 300 by Bartel and 100 by Tuschl (Bartel et. al., Science 294 ,858 (2001); Tuschl et. al., Science 294 ,853 (2001)), the RNA genes found can not be much rarer than 1% of all RNA genes. The recently detected miRNA genes therefore represent the more prevalent among the miRNA gene family.

[0009] Current methodology has therefore been unable to detect RNA genes which either do not present a visually discernable whole body phenotype, or are rare (e.g. rarer than

0.1% of all RNA genes), and therefore do not produce significant enough quantities of RNA so as to be detected by standard biochemical technique. To date, miRNA have not been detected in viruses.

SUMMARY OF INVENTION

- [0010] The present invention relates to a novel group of bioinformatically detectable, viral regulatory RNA genes, which repress expression of host target host genes, by means of complementary hybridization to binding sites in untranslated regions of these host target host genes. It is believed that this novel group of viral genes represent a pervasive viral mechanism of attacking hosts, and that therefore knowledge of this novel group of viral genes may be useful in preventing and treating viral diseases.
- [0011] In various preferred embodiments, the present invention seeks to provide improved method and system for detection and prevention of viral disease, which is mediated by this group of novel viral genes.
- [0012] Accordingly, the invention provides several substantially pure nucleic acids (e.g., genomic nucleic acid, cDNA or synthetic nucleic acid) each encoding a novel viral gene of the VGAM group of gene, vectors comprising the nucleic acids, probes comprising the nucleic acids, a method

and system for selectively modulating translation of known "target" genes utilizing the vectors, and a method and system for detecting expression of known "target" genes utilizing the probe.

[0013] By "substantially pure nucleic acid" is meant nucleic acid that is free of the genes which, in the naturally-occurring genome of the organism from which the nucleic acid of the invention is derived, flank the genes discovered and isolated by the present invention. The term therefore includes, for example, a recombinant nucleic acid which is incorporated into a vector, into an autonomously replicating plasmid or virus, or into the genomic nucleic acid of a prokaryote or eukaryote at a site other than its natural site; or which exists as a separate molecule (e.g., a cDNA or a genomic or cDNA fragment produced by PCR or restriction endonuclease digestion) independent of other sequences. It also includes a recombinant nucleic acid which is part of a hybrid gene encoding additional polypeptide sequence.

[0014] "Inhibiting translation" is defined as the ability to prevent synthesis of a specific protein encoded by a respective gene, by means of inhibiting the translation of the mRNA of this gene. "Translation inhibitor site" is defined as the

minimal nucleic acid sequence sufficient to inhibit translation.

[0015] There is thus provided in accordance with a preferred embodiment of the present invention a bioinformatically detectable novel viral gene encoding substantially pure nucleic acid wherein: RNA encoded by the bioinformatically detectable novel viral gene is about 18 to about 24 nucleotides in length, and originates from an RNA precursor, which RNA precursor is about 50 to about 120 nucleotides in length, a nucleotide sequence of a first half of the RNA precursor is a partial inversed-reversed sequence of a nucleotide sequence of a second half thereof, a nucleotide sequence of the RNA encoded by the novel viral gene is a partial inversed-reversed sequence of a nucleotide sequence of a binding site associated with at least one host target gene, and a function of the novel viral gene is bioinformatically deducible.

[0016] There is further provided in accordance with another preferred embodiment of the present invention a method for anti-viral treatment comprising neutralizing said RNA.

[0017] Further in accordance with a preferred embodiment of the present invention the neutralizing comprises: synthesizing a complementary nucleic acid molecule, a nucleic se-

quence of which complementary nucleic acid molecule is a partial inversed–reversed sequence of said RNA, and transfecting host cells with the complementary nucleic acid molecule, thereby complementarily binding said RNA.

[0018] Further in accordance with a preferred embodiment of the present invention the neutralizing comprises immunologically neutralizing.

[0019] There is still further provided in accordance with another preferred embodiment of the present invention a bioinformatically detectable novel viral gene encoding substantially pure nucleic acid wherein: RNA encoded by the bioinformatically detectable novel viral gene includes a plurality of RNA sections, each of the RNA sections being about 50 to about 120 nucleotides in length, and including an RNA segment, which RNA segment is about 18 to about 24 nucleotides in length, a nucleotide sequence of a first half of each of the RNA sections encoded by the novel viral gene is a partial inversed–reversed sequence of nucleotide sequence of a second half thereof, a nucleotide sequence of each of the RNA segments encoded by the novel viral gene is a partial inversed–reversed sequence of the nucleotide sequence of a binding site associated with at least one target host gene, and a function of the novel

viral gene is bioinformatically deducible from the following data elements: the nucleotide sequence of the RNA encoded by the novel viral gene, a nucleotide sequence of the at least one target host gene, and function of the at least one target host gene.

[0020] Further in accordance with a preferred embodiment of the present invention the function of the novel viral gene is bioinformatically deducible from the following data elements: the nucleotide sequence of the RNA encoded by the bioinformatically detectable novel viral gene, a nucleotide sequence of the at least one target host gene, and a function of the at least one target host gene.

[0021] Still further in accordance with a preferred embodiment of the present invention the RNA encoded by the novel viral gene complementarily binds the binding site associated with the at least one target host gene, thereby modulating expression of the at least one target host gene.

[0022] Additionally in accordance with a preferred embodiment of the present invention the binding site associated with at least one target host gene is located in an untranslated region of RNA encoded by the at least one target host gene.

[0023] Moreover in accordance with a preferred embodiment of

the present invention the function of the novel viral gene is selective inhibition of translation of the at least one target host gene, which selective inhibition includes complementary hybridization of the RNA encoded by the novel viral gene to the binding site.

[0024] Further in accordance with a preferred embodiment of the present invention the invention includes a vector including the DNA.

[0025] Still further in accordance with a preferred embodiment of the present invention the invention includes a method of selectively inhibiting translation of at least one gene, including introducing the vector.

[0026] Moreover in accordance with a preferred embodiment of the present invention the introducing includes utilizing RNAi pathway.

[0027] Additionally in accordance with a preferred embodiment of the present invention the invention includes a gene expression inhibition system including: the vector, and a vector inserter, functional to insert the vector into a cell, thereby selectively inhibiting translation of at least one gene.

[0028] Further in accordance with a preferred embodiment of the present invention the invention includes a probe including

the DNA.

[0029] Still further in accordance with a preferred embodiment of the present invention the invention includes a method of selectively detecting expression of at least one gene, including using the probe.

[0030] Additionally in accordance with a preferred embodiment of the present invention the invention includes a gene expression detection system including: the probe, and a gene expression detector functional to selectively detect expression of at least one gene.

[0031] Further in accordance with a preferred embodiment of the present invention the invention includes an anti-viral substance capable of neutralizing the RNA.

[0032] Still further in accordance with a preferred embodiment of the present invention the neutralizing includes complementarily binding the RNA.

[0033] Additionally in accordance with a preferred embodiment of the present invention the neutralizing includes immunologically neutralizing.

[0034] Moreover in accordance with a preferred embodiment of the present invention the invention includes a method for anti-viral treatment including neutralizing the RNA.

[0035] Further in accordance with a preferred embodiment of the

present invention the neutralizing includes: synthesizing a complementary nucleic acid molecule, a nucleic sequence of which complementary nucleic acid molecule is a partial inversed-reversed sequence of the RNA, and transfecting host cells with the complementary nucleic acid molecule, thereby complementarily binding the RNA.

[0036] Still further in accordance with a preferred embodiment of the present invention the neutralizing includes immunologically neutralizing.

BRIEF DESCRIPTION OF SEQUENCES

[0060] A Sequence Listing of genomic sequences of the present invention designated SEQ ID:1 through SEQ ID:3750 is attached to this application. The genomic listing comprises the following nucleotide sequences: Genomic sequences designated SEQ ID:1 through SEQ ID:349 are nucleotide sequences of 349 gene precursors of respective novel genes of the present invention; Genomic sequences designated SEQ ID:350 through SEQ ID:698 are nucleotide sequences of 349 genes of the present invention; and Genomic sequences designated SEQ ID:699 through SEQ ID:3750 are nucleotide sequences of 3052 host target binding sites.

DETAILED DESCRIPTION

[0061] Reference is now made to Fig. 1 which is a simplified diagram illustrating a mode by which genes of a novel group of viral genes of the present invention, modulate expression of known host target genes.

[0062] The novel genes of the present invention are viral micro RNA (miRNA)-like, regulatory RNA genes, modulating expression of known host target genes. This mode of modulation is common to other known miRNA genes, as described hereinabove with reference to the background of the invention section.

[0063] VGAM GENE is a viral gene contained in the virus genome and TARGET GENE is a human gene contained in the DNA of the human genome.

[0064] VGAM GENE encodes a VGAM PRECURSOR RNA. However, similar to other miRNA genes, and unlike most ordinary genes, its RNA, VGAM PRECURSOR RNA, does not encode a protein.

[0065] VGAM PRECURSOR RNA folds onto itself, forming VGAM FOLDED PRECURSOR RNA. As Fig.1 illustrates, VGAM FOLDED PRECURSOR RNA forms a "hairpin structure" folding onto itself. As is well known in the art, this "hairpin structure" is typical genes of the miRNA genes, and is due to the fact that nucleotide sequence of the first half of the RNA of a gene in this group is an accurate or partial inversed-reversed sequence of the nucleotide sequence of its second half. By "inversed-reversed" is meant a sequence which is reversed and wherein each nucleotide is

replaced by a complimentary nucleotide, as is well known in the art (e.g. ATGGC is the inversed-reversed sequence of GCCAT).

[0066] An enzyme complex, designated DICER COMPLEX, "dices" the VGAM FOLDED PRECURSOR RNA into a single stranded RNA segment, about 22 nucleotides long, designated VGAM RNA. As is known in the art, "dicing" of the hairpin structured RNA precursor into shorter RNA segments about 22 nucleotides long by a Dicer type enzyme is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins.

[0067] VGAM HOST TARGET GENE encodes a corresponding messenger RNA, designated VGAM HOST TARGET RNA. This VGAM HOST TARGET RNA comprises three regions: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[0068] VGAM RNA binds complementarily a BINDING SITE, located on the 3'UTR segment of TARGET RNA. This complementarily binding is due to the fact that the nucleotide sequence of VGAM RNA is an accurate or partial inversed-reversed sequence of the nucleotide sequence of BINDING SITE.

[0069] The complimentary binding of VGAM RNA to BINDING SITE inhibits translation of VGAM HOST TARGET RNA into VGAM HOST TARGET PROTEIN. VGAM HOST TARGET PROTEIN is therefore outlined by a broken line.

[0070] It is appreciated by one skilled in the art that the mode of transcriptional inhibition illustrated by Fig. 1 with specific reference to VGAM genes of the present invention, is in fact common to all other miRNA genes. A specific complimentary binding site has been demonstrated only for Lin-4 and Let-7. All the other 93 newly discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complimentary binding, although specific complimentary binding sites for these genes have not yet been found (Ruvkun G., "Perspective: Glimpses of a tiny RNA world", Science 294 ,779 (2001)). The present invention discloses a novel group of viral genes, the VGAM genes, belonging to the miRNA genes group, and for which a specific an complimentary binding has been determined.

[0071] Reference is now made to Fig. 2 which is a simplified block diagram illustrating a bioinformatic gene detection system capable of detecting genes of the novel group of genes of the present invention, which system is con-

structed and operative in accordance with a preferred embodiment of the present invention.

[0072] A centerpiece of the present invention is a bioinformatic gene detection engine 100, which is a preferred implementation of a mechanism capable of bioinformatically detecting genes of the novel group of genes of the present invention.

[0073] The function of the bioinformatic gene detection engine 100 is as follows: it receives three types of input, expressed RNA data 102, sequenced DNA data 104, and protein function data 106, performs a complex process of analysis of this data as elaborated below, and based on this analysis produces output of a bioinformatically detected group of novel genes designated 108.

[0074] Expressed RNA data 102 comprises published expressed sequence tags (EST) data, , published mRNA data, as well as other sources of published RNA data. Sequenced DNA data 104 comprises alphanumeric data describing sequenced genomic data, which preferably includes annotation data such as location of known protein coding regions relative to the sequenced data. Protein function data 106 comprises scientific publications reporting studies which elucidated physiological function known proteins,

and their connection, involvement and possible utility in treatment and diagnosis of various diseases. Expressed RNA data 102, sequenced DNA data 104 may preferably be obtained from data published by the National Center for Bioinformatics (NCBI) at the National Institute of Health (NIH), as well as from various other published data sources. Protein function data 106 may preferably be obtained from any one of numerous relevant published data sources, such as the Online Mendelian Inherited Disease In Man (OMIM) database developed by John Hopkins University, and also published by NCBI.

[0075] Prior to actual detection of bioinformatically detected novel genes 108 by the bioinformatic gene detection engine 100, a process of bioinformatic gene detection engine training & validation designated 110 takes place. This process uses the known miRNA genes as a training set (some 200 such genes have been found to date using biological laboratory means), to train the bioinformatic gene detection engine 100 to bioinformatically recognize miRNA-like genes, and their respective potential target binding sites. Bioinformatic gene detection engine training & validation 110 is further describe hereinbelow with reference to Fig. 3.

[0076] The bioinformatic gene detection engine 100 comprises several modules which are preferably activated sequentially, and are described as follows:

[0077] A non-coding genomic sequence detector 112 operative to bioinformatically detect non-protein coding genomic sequences. The non-coding genomic sequence detector 112 is further described hereinbelow with reference to Figs. 4A and 4B.

[0078] A hairpin detector 114 operative to bioinformatically detect genomic "hairpin-shaped" sequences, similar to VGAM FOLDED PRECURSOR of Fig. 1. The hairpin detector 114 is further described hereinbelow with reference to Figs. 5A and 5B.

[0079] A dicer-cut location detector 116 operative to bioinformatically detect the location on a hairpin shaped sequence which is enzymatically cut by DICER COMPLEX of Fig. 1. The dicer-cut location detector 116 is further described hereinbelow with reference to Fig. 6A.

[0080] A target-gene binding-site detector 118 operative to bioinformatically detect host target having binding sites, the nucleotide sequence of which is partially complementary to that of a given genomic sequence, such as a sequence cut by DICER COMPLEX of Fig. 1. The target-gene

binding-site detector 118 is further described hereinbelow with reference to Figs. 7A and 7B.

[0081] A function & utility analyzer 120 operative to analyze function and utility of host target, in order to identify host target which have a significant clinical function and utility. The function & utility analyzer 120 is further described hereinbelow with reference to Fig. 8.

[0082] Hardware implementation of the bioinformatic gene detection engine 100 is important, since significant computing power is preferably required in order to perform the computation of bioinformatic gene detection engine 100 in reasonable time and cost. As an example, it is estimated that using one powerful 8-processor PC Server, over 30 months of computing time (at 24 hours per day) would be required in order to detect all miRNA genes in human EST data, and their respective binding sites.

[0083] For example, in order to address this challenge at reasonable time and cost, a preferred embodiment of the present invention may comprise a cluster of a large number of personal computers (PCs), such as 100 PCs (Pentium IV, 1.7GHz, with 40GB storage each), connected by Ethernet to several strong servers, such as 4 servers (2-CPU, Xeon 2.2GHz, with 200GB storage each), com-

bined with an 8-processor server (8-CPU, Xeon 550Mhz w/ 8GB RAM) connected via 2 HBA fiber-channels to an EMC Clariion 100-disks, 3.6 Terabyte storage device. Additionally, preferably an efficient database computer program, such as Microsoft (TM) SQL-Server database computer program is used and is optimized to the specific requirements of bioinformatic gene detection engine 100. Furthermore, the PCs are preferably optimized to operate close to 100% CPU usage continuously, as is known in the art. Using suitable hardware and software may preferably reduce the required calculation time in the abovementioned example from 30 months to 20 days.

[0084] It is appreciated that the abovementioned hardware configuration is not meant to be limiting, and is given as an illustration only. The present invention may be implemented in a wide variety of hardware and software configurations.

[0085] The present invention discloses 349 novel viral genes of the VGAM group of genes, which have been detected bioinformatically, as described hereinbelow with reference to Fig. 1 through Fig. 8. Laboratory confirmation of 4 genes of the GAM group of genes is described hereinbelow with reference to Figs. 12 through 14.

[0086] Reference is now made to Fig. 3 which is a simplified flowchart illustrating operation of a mechanism for training of a computer system to recognize the novel genes of the present invention. This mechanism is a preferred implementation of the bioinformatic gene detection engine training & validation 110 described hereinabove with reference to Fig. 2.

[0087] Bioinformatic gene detection engine training & validation 110 of Fig. 2 begins by training the bioinformatic gene detection engine to recognize known miRNA genes, as designated by numeral 122. This training step comprises hairpin detector training & validation 124, further described hereinbelow with reference to Fig. 12 A, dicer-cut location detector training & validation 126, further described hereinbelow with reference to Fig. 6A and 6B, and target-gene binding-site detector training & validation 128, further described hereinbelow with reference to Fig. 7A.

[0088] Next, the bioinformatic gene detection engine 100 is used to bioinformatically detect sample novel genes, as designated by numeral 130. An example of a sample novel gene thus detected is described hereinbelow with reference to Fig. 12.

[0089] Finally, wet lab experiments are preferably conducted in order to validate expression and preferably function the sample novel genes detected by the bioinformatic gene detection engine 100 in the previous step. An example of wet-lab validation of the abovementioned sample novel gene bioinformatically detected by the system is described hereinbelow with reference to Figs. 13A and 13B.

[0090] Reference is now made to Fig. 4A which is a simplified block diagram of a preferred implementation of the non-coding genomic sequence detector 112 described hereinabove with reference to Fig. 2. Non-protein coding genomic sequence detector 112 of Fig. 2 preferably receives as input at least two types of published genomic data: expressed RNA data 102, including EST data and mRNA data, and sequenced DNA data 104. After its initial training, indicated by numeral 134, and based on the abovementioned input data, the non-protein coding genomic sequence detector 112 produces as output a plurality of non-protein coding genomic sequences 136. Preferred operation of the non-protein coding genomic sequence detector 112 is described hereinbelow with reference to Fig. 4B.

[0091] Reference is now made to Fig. 4B which is a simplified

flowchart illustrating a preferred operation of the non-coding genomic sequence detector 112 of Fig. 2. Detection of non-protein coding genomic sequences to be further analyzed by the system generally preferably progresses in one of the following two paths.

[0092] A first path for detecting non-protein coding genomic sequences begins by receiving a plurality of known RNA sequences, such as EST data. Each RNA sequence is first compared to all known protein-coding sequences, in order to select only those RNA sequences which are non-protein coding. This can preferably be performed by BLAST comparison of the RNA sequence to known protein coding sequences. The abovementioned BLAST comparison to the DNA preferably also provides the localization of the RNA on the DNA.

[0093] Optionally, an attempt may be made to "expend" the non-protein RNA sequences thus found, by searching for transcription start and end signals, upstream and downstream of location of the RNA on the DNA respectively, as is well known in the art.

[0094] A second path for detecting non-protein coding genomic sequences starts by receiving DNA sequences. The DNA sequences are parsed into non protein coding sequences,

based on published DNA annotation data: extracting those DNA sequences which are between known protein coding sequences. Next, transcription start and end signals are sought. If such signals are found, and depending on their "strength", probable expressed non-protein coding genomic sequences are yielded.

[0095] Reference is now made to Fig. 5A which is a simplified block diagram of a preferred implementation of the hairpin detector 114 described hereinabove with reference to Fig. 2.

[0096] The goal of the hairpin detector 114 is to detect "hairpin" shaped genomic sequences, similar to those of known miRNA genes. As mentioned hereinabove with reference to Fig. 1, a "hairpin" genomic sequence refers to a genomic sequence which "folds onto itself" forming a hairpin like shape, due to the fact that nucleotide sequence of the first half of the nucleotide sequence is an accurate or

[0097] The hairpin detector 114 of Fig. 2 receives as input a plurality of non-protein coding genomic sequences 136 of Fig. 4A, and after a phase of hairpin detector training & validation 124 of Fig. 3, is operative to detect and output "hairpin shaped" sequences found in the input expressed non-protein coding sequences, designated by numeral

138.

[0098] The phase of hairpin detector training & validation 124 is an iterative process of applying the hairpin detector 114 to known hairpin shaped miRNA genes, calibrating the hairpin detector 114 such that it identifies the training set of known hairpins, as well as sequences which are similar thereto. Preferred operation of the hairpin detector 114 is described hereinbelow with reference to Fig. 5B.

[0099] Reference is now made to Fig. 5B which is a simplified flowchart illustrating a preferred operation of the hairpin detector 114 of Fig. 2.

[0100] A hairpin structure is a two dimensional folding structure, resulting from the nucleotide sequence pattern: the nucleotide sequence of the first half of the hairpin sequence is an inversed-reversed sequence of the second half thereof. Different methodologies are known in the art for detection of various two dimensional and three dimensional hairpin structures.

[0101] In a preferred embodiment of the present invention, the hairpin detector 114 initially calculates possible 2-dimensional (2D) folding patterns of a given one of the non-protein coding genomic sequences 136, preferably using a 2D folding algorithm based on free-energy calcu-

lation, such as the Zucker algorithm, as is well known in the art.

[0102] Next, the hairpin detector 114 analyzes the results of the 2D folding, in order to determine the presence, and location of hairpin structures. A 2D folding algorithm typically provides as output a listing of the base-pairing of the 2D folded shape, i.e. a listing of which all two pairs of nucleotides in the sequence which will bond. The goal of this second step, is to assess this base-pairing listing, in order to determine if it describes a hairpin type bonding pattern.

[0103] The hairpin detector 114 then assess those hairpin structures found by the previous step, comparing them to hairpins of known miRNA genes, using various parameters such as length, free-energy, amount and type of mismatches, etc. Only hairpins that bear statistically significant resemblance of the population of hairpins of known miRNAs, according to the abovementioned parameters are accepted.

[0104] Lastly, the hairpin detector 114 attempts to select those hairpin structures which are as stable as the hairpins of known miRNA genes. This may be achieved in various manners. A preferred embodiment of the present invention

utilizes the following methodology comprising three steps:

[0105] First, the hairpin detector 114 attempts to group potential hairpins into "families" of closely related hairpins. As is known in the art, a free-energy calculation algorithm, typically provides multiple "versions" each describing a different possible 2D folding pattern for the given genomic sequence, and the free energy of such possible folding. The hairpin detector 114 therefore preferably assesses all hairpins found on all "versions", grouping hairpins which appear in different versions, but which share near identical locations into a common "family" of hairpins. For example, all hairpins in different versions, the center of which is within 7 nucleotides of each other may preferably be grouped to a single "family".

[0106] Next, hairpin "families" are assessed, in order to select only those families which represent hairpins that are as stable as those of known miRNA hairpins. For example, preferably only families which are represented in at least 65% of the free-energy calculation 2D folding versions, are considered stable.

[0107] Finally, an attempt is made to select the most suitable hairpin from each selected family. For example, preferably

the hairpin which appears in more versions than other hairpins, and in versions the free-energy of which is lower, may be selected.

- [0108] Reference is now made to Fig. 6A which is a simplified block diagram of a preferred implementation of the dicer-cut location detector 116 described hereinabove with reference to Fig. 2.
- [0109] The goal of the dicer-cut location detector 116 is to detect the location in which DICER COMPLEX of Fig. 1, comprising the enzyme Dicer, would "dice" the given hairpin sequence, similar to VGAM FOLDED PRECURSOR RNA, yielding VGAM RNA both of Fig. 1.
- [0110] The dicer-cut location detector 116 of Fig. 2 therefore receives as input a plurality of hairpins on genomic sequences 138 of Fig. 5A, which were calculated by the previous step, and after a phase of dicer-cut location detector training & validation 126 of Fig. 3, is operative to detect a respective plurality of dicer-cut sequences from hairpins 140, one for each hairpin.
- [0111] In a preferred embodiment of the present invention, the dicer-cut location detector 116 preferably uses a combination of neural networks, Bayesian networks, Markovian modeling, and Support Vector Machines (SVMs) trained on

the known dicer-cut locations of known miRNA genes, in order to detect dicer-cut locations. Dicer-cut location detector training & validation 126, which is further described hereinbelow with reference to Fig. 6B.

[0112] Reference is now made to Fig. 6 B which is a simplified flowchart illustrating a preferred implementation of dicer-cut location detector training & validation 126 of Fig. 3. Dicer-cut location detector 116 first preprocesses known miRNA hairpins and their respective dicer-cut locations, so as to be able to properly analyze them and train the detection system accordingly:

[0113] The folding pattern is calculated for each known miRNA, preferably based on free-energy calculation, and the size of the hairpin, the size of the loop at the center of the hairpin, and "bulges" (i.e. mismatched base-pairs) in the folded hairpin are noted.

[0114] The dicer-cut location, which is known for known miRNA genes, is noted relative to the above, as well as to the nucleotides in each location along the hairpin. Frequency of identity of nucleotides, and nucleotide-pairing, relative to their location in the hairpin, and relative to the known dicer-cut location in the known miRNA genes is analyzed and modeled.

[0115] Different techniques are well known in the art for analysis of existing pattern from a given "training set" of species belonging to a genus, which techniques are then capable, to a certain degree, to detect similar patterns in other species not belonging to the training-set genus. Such techniques include, but are not limited to neural networks, Bayesian networks, Support Vector Machines (SVM), Genetic Algorithms, Markovian modeling, and others, as is well known in the art.

[0116] Using such techniques, preferably a combination of several of the above techniques, the known hairpins are represented as a several different networks (such as neural, Bayesian, or SVM) input and output layers. Both nucleotide, and "bulge" (i.e. nucleotide pairing or mismatch) are represented for each position in the hairpin, at the input layer, and a corresponding true/false flag at each position, indicating whether it was diced by dicer at the output layer. Multiple networks are preferably used concurrently, and the results therefrom are integrated and further optimized. Markovian modeling may also be used to validate the results and enhance their accuracy. Finally, the bioinformatic detection of dicer-cut location of a sample novel is confirmed by wet-lab experimentation.

[0117] Reference is now made to Fig. 7A which is a simplified block diagram of a preferred implementation of the target-gene binding-site detector 118 described hereinabove with reference to Fig. 2. The goal of the target-gene binding-site detector 118 is to detect a BINDING SITE of Fig. 1, located in an untranslated region of the RNA of a known gene, the nucleotide sequence of which BINDING SITE is at least partially complementary to that of a VGAM RNA of Fig. 1, thereby determining that the abovementioned known gene is a target gene of VGAM of Fig. 1.

[0118] The target-gene binding-site detector 118 of Fig. 2 therefore receives as input a plurality of dicer-cut sequences from hairpins 140 of Fig. 6A which were calculated by the previous step, and a plurality of potential target gene sequences 142 which derive sequence DNA data 104 of Fig. 2, and after a phase of target-gene binding-site detector training & validation 128 of Fig. 3, is operative to detect target-genes having binding site/s 144 the nucleotide sequence of which is at least partially complementary to that of each of the plurality of dicer-cut sequences from hairpins 140. Preferred operation of the target-gene binding-site detector is further described

hereinbelow with reference to Fig. 7B.

[0119] Reference is now made to Fig. 7B which is a simplified flowchart illustrating a preferred operation of the target-gene binding-site detector 118 of Fig. 2. In a preferred embodiment of the present invention, the target-gene binding-site detector 118 first performs a BLAST comparison of the nucleotide sequence of each of the plurality of dicer-cut sequences from hairpins 140, to the potential target gene sequences 142, in order to find crude potential matches. Blast results are then filtered to results which are similar to those of known binding sites (e.g. binding sites of miRNA genes Lin-4 and Let-7 to target genes Lin-14, Lin-41, Lin 28 etc.). Next the binding site is expanded, checking if nucleotide sequenced immediately adjacent to the binding site found by BLAST, may improve the match. Suitable binding sites, then are computed for free-energy and spatial structure. The results are analyzed, selecting only those binding sites, which have free-energy and spatial structure similar to that of known binding sites.

[0120] Reference is now made to Fig. 8 which is a simplified flowchart illustrating a preferred operation of the function & utility analyzer 120 described hereinabove with refer-

ence to Fig. 2. The goal of the function & utility analyzer 120 is to determine if a potential target gene is in fact a valid clinically useful target gene. Since a potential novel VGAM gene binding a binding site in the UTR of a target gene is understood to inhibit expression of that target gene, and if that target gene is shown to have a valid clinical utility, then in such a case it follows that the potential novel gene itself also has a valid useful function which is the opposite of that of the target gene.

[0121] The function & utility analyzer 120 preferably receives as input a plurality of potential novel target genes having binding-site/s 144, generated by the target-gene binding-site detector 118, both of Fig. 7A. Each potential gene, is evaluated as follows:

[0122] First the system first checks to see if the function of the potential target gene is scientifically well established. Preferably, this can be achieved bioinformatically by searching various published data sources presenting information on known function of proteins. Many such data sources exist and are published as is well known in the art.

[0123] Next, for those target genes the function of which is scientifically known and is well documented, the system then

checks if scientific research data exists which links them to known diseases. For example, a preferred embodiment of the present invention utilizes the OMIM(TM) database published by NCBI, which summarizes research publications relating to genes which have been shown to be associated with diseases.

[0124] Finally, the specific possible utility of the target gene is evaluated. While this process too may be facilitated by bioinformatic means, it might require human evaluation of published scientific research regarding the target gene, in order to determine the utility of the target gene to the diagnosis and or treatment of specific disease. Only potential novel genes, the target-genes of which have passed all three examinations, are accepted as novel genes.

[0125] Reference is now made to Fig. 9, which is a simplified diagram describing a novel bioinformatically detected group of regulatory genes, referred to here as Viral Genomic Record (VGR) genes, that encode an "operon-like" cluster of novel viral miRNA-like genes, each modulating expression of a plurality of host target genes, the function and utility of which target genes is known.

[0126] VGR GENE (Viral Genomic Record Gene) is gene of a novel bioinformatically detected group of regulatory, non pro-

tein coding, RNA genes. The method by which VGR is detected is described hereinabove with reference to FIGS. 1-9.

[0127] VGR GENE encodes an RNA molecule, typically several hundred nucleotides long, designated VGR PRECURSOR RNA.

[0128] VGR PRECURSOR RNA folds spatially, as illustrated by VGR FOLDED PRECURSOR RNA, into a plurality of what is known in the art as "hairpin structures. The nucleotide sequence of VGR PRECURSOR RNA comprises a plurality of segments, the first half of each such segment having a nucleotide sequence which is at least a partial inversed-reversed sequence of the second half thereof, thereby causing formation of a plurality of "hairpin" structures, as is well known in the art.

[0129] VGR FOLDED PRECURSOR RNA is naturally processed by cellular enzymatic activity, into 3 separate hairpin shaped RNA segments, each corresponding to VGAM FOLDED PRECURSOR RNA of Fig. 1, designated VGAM1 FOLDED PRECURSOR, VGAM2 FOLDED PRECURSOR and VGAM3 FOLDED PRECURSOR respectively.

[0130] The above mentioned VGAM precursors, are diced by DICER COMPLEX of FIG. 1, yielding short RNA segments of

about 22 nucleotides in length, each corresponding to VGAM RNA of FIG. 1, designated VGAM1 RNA, VGAM2 RNA and VGAM3 RNA respectively.

[0131] VGAM1 RNA, VGAM2 RNA and VGAM3 RNA each bind complementarily to binding sites located in untranslated regions of respective host target, designated VGAM1-HOST TARGET RNA, VGAM2-HOST TARGET RNA and VGAM3-HOST TARGET RNA respectively. This binding inhibits translation of the respective target proteins designated VGAM1-HOST TARGET PROTEIN, VGAM2-HOST TARGET PROTEIN and VGAM3-HOST TARGET PROTEIN respectively.

[0132] The structure of VGAM genes comprised in a VGR GENE, and their mode of modulation of expression of their respective target genes is described hereinabove with reference to Fig. 1. The bioinformatic approach to detection of VGAM genes comprised in a VGR GENE is described hereinabove with reference to Figs. 1 through 9.

[0133] The present invention discloses 426 novel viral genes of the VGR group of genes, which have been detected bioinformatically, as described hereinbelow with reference to Fig. 1 through Fig. 9. Laboratory confirmation of three genes of the VGR group of genes is described hereinbelow

with reference to Figs. 12A through 14B.

[0134] In summary, the current invention discloses a very large number of novel viral VGR genes, each of which encodes a plurality of VGAM genes, which in turn may modulate expression of a plurality of host target proteins.

[0135] Reference is now made to Fig. 10 which is a block diagram illustrating different utilities of genes of the novel group of genes of the present invention referred to here as VGAM genes and VGR genes.

[0136] The present invention discloses a first plurality of novel genes referred to here as VGAM genes, and a second plurality of operon-like genes referred to here as VGR genes, each of the VGR genes encoding a plurality of VGAM genes. The present invention further discloses a very large number of known target-genes, which are bound by, and the expression of which is modulated by each of the novel genes of the present invention. Published scientific data referenced by the present invention provides specific, substantial, and credible evidence that the abovementioned target genes modulated by novel genes of the present invention, are associated with various diseases. Specific novel genes of the present invention, target genes thereof and diseases associated therewith, are described

hereinbelow with reference to Fig. 1 through Fig. 8. It is therefore appreciated that a function of VGAM genes and VGR genes of the present invention is modulation of expression of target genes related to known diseases, and that therefore utilities of novel genes of the present invention include diagnosis and treatment of the above-mentioned diseases. Fig. 10 describes various types of diagnostic and therapeutic utilities of novel genes of the present invention.

[0137] A utility of novel genes of the present invention is detection of VGAM genes and of VGR genes. It is appreciated that since VGAM genes and VGR genes modulate expression of disease related target genes, that detection of expression of VGAM genes in clinical scenarios associated with said diseases is a specific, substantial and credible utility. Diagnosis of novel genes of the present invention may preferably be implemented by RNA expression detection techniques, including but not limited to biochips, as is well known in the art. Diagnosis of expression of genes of the present invention may be useful for research purposes, in order to further understand the connection between the novel genes of the present invention and the abovementioned related diseases, for disease diagnosis

and prevention purposes, and for monitoring disease progress.

[0138] Another utility of novel genes of the present invention is anti-VGAM gene therapy, a mode of therapy which allows up regulation of a disease related target-gene of a novel VGAM gene of the present invention, by lowering levels of the novel VGAM gene which naturally inhibits expression of that target gene. This mode of therapy is particularly useful with respect to target genes which have been shown to be under-expressed in association with a specific disease. Anti-VGAM gene therapy is further discussed hereinbelow with reference to Figs. 11A and 11B.

[0139] A further utility of novel genes of the present invention is VGAM replacement therapy, a mode of therapy which achieves down regulation of a disease related target-gene of a novel VGAM gene of the present invention, by raising levels of the VGAM gene which naturally inhibits expression of that target gene. This mode of therapy is particularly useful with respect to target genes which have been shown to be over-expressed in association with a specific disease. VGAM replacement therapy involves introduction of supplementary VGAM gene products into a cell, or stimulation of a cell to produce excess VGAM gene prod-

ucts. VGAM replacement therapy may preferably be achieved by transfecting cells with an artificial DNA molecule encoding a VGAM gene, which causes the cells to produce the VGAM gene product, as is well known in the art.

[0140] Yet a further utility of novel genes of the present invention is modified VGAM therapy. Disease conditions are likely to exist, in which a mutation in a binding site of a VGAM gene prevents natural VGAM gene to effectively bind inhibit a disease related target-gene, causing up regulation of that target gene, and thereby contributing to the disease pathology. In such conditions, a modified VGAM gene is designed which effectively binds the mutated VGAM binding site, i.e. is an effective anti-sense of the mutated VGAM binding site, and is introduced in disease effected cells. Modified VGAM therapy is preferably achieved by transfecting cells with an artificial DNA molecule encoding the modified VGAM gene, which causes the cells to produce the modified VGAM gene product, as is well known in the art.

[0141] An additional utility of novel genes of the present invention is induced cellular differentiation therapy. As aspect of the present invention is finding genes which determine

cellular differentiation, as described hereinabove with reference to Fig. 11. Induced cellular differentiation therapy comprises transfection of cell with such VGAM genes thereby determining their differentiation as desired. It is appreciated that this approach may be widely applicable, inter alia as a means for auto transplantation harvesting cells of one cell-type from a patient, modifying their differentiation as desired, and then transplanting them back into the patient. It is further appreciated that this approach may also be utilized to modify cell differentiation in vivo, by transfecting cells in a genetically diseased tissue with a cell-differentiation determining VGAM gene, thus stimulating these cells to differentiate appropriately.

[0142] Reference is now made to Figs. 11A and 11B, simplified diagrams which when taken together illustrate anti-VGAM gene therapy mentioned hereinabove with reference to Fig. 10. A utility of novel genes of the present invention is anti-VGAM gene therapy, a mode of therapy which allows up regulation of a disease related target-gene of a novel VGAM gene of the present invention, by lowering levels of the novel VGAM gene which naturally inhibits expression of that target gene. Fig. 11A shows a normal VGAM gene, inhibiting translation of a target gene of VGAM gene, by

binding to a BINDING SITE found in an untranslated region of TARGET RNA, as described hereinabove with reference to Fig. 1.

[0143] Fig. 11B shows an example of anti-VGAM gene therapy. ANTI-VGAM RNA is short artificial RNA molecule the sequence of which is an anti-sense of VGAM RNA. Anti-VGAM treatment comprises transfecting diseased cells with ANTI-VGAM RNA, or with a DNA encoding thereof. The ANTI-VGAM RNA binds the natural VGAM RNA, thereby preventing binding of natural VGAM RNA to its BINDING SITE. This prevents natural translation inhibition of TARGET RNA by VGAM RNA, thereby up regulating expression of TARGET PROTEIN.

[0144] It is appreciated that anti-VGAM gene therapy is particularly useful with respect to target genes which have been shown to be under-expressed in association with a specific disease.

[0145] Reference is now made to Fig. 12A which is an annotated sequence of an EST comprising a novel gene detected by the gene detection system of the present invention. Fig. 12A shows the nucleotide sequence of a known human non-protein coding EST (Expressed Sequence Tag), identified as EST72223. It is appreciated that the sequence of

this EST comprises sequences of one known miRNA gene, identified as MIR98, and of one novel GAM gene, referred to here as GAM24, detected by the bioinformatic gene detection system of the present invention, described hereinabove with reference to Fig. 2.

[0146] Reference is now made to Figs. 12B and 12C that are pictures of laboratory results, which when taken together demonstrate laboratory confirmation of expression of the bioinformatically detected novel gene of Fig. 12A. Reference is now made to Fig. 12B which is a Northern blot analysis of MIR-98 and EST72223 transcripts. MIR-98 and EST72223 were reacted with MIR-98 and GAM24 probes as indicated in the figure. It is appreciated that the probes of both MIR-98 and GAM24 reacted with EST72223, indicating that EST72223 contains the sequences of MIR-98 and of GAM24. It is further appreciated that the probe of GAM24 does not cross-react with MIR-98.

[0147] Reference is now made to Fig. 12C. A Northern blot analysis of EST72223 and MIR-98 transfections were performed, subsequently marking RNA by the MIR-98 and GAM24 probes. Left, Northern reacted with MIR-98, Right, Northern reacted with GAM24. The molecular Sizes of EST72223, MIR-98 and GAM24 are indicated by arrows.

Hela are control cells that have not been introduced to exogenous RNA. EST and MIR-98 Transfections are RNA obtained from Hela transfected with EST72223 and MIR-98, respectively. MIR-98 and EST are the transcripts used for the transfection experiment. The results indicate that EST72223, when transfected into Hela cells, is cut yielding known miRNA gene MIR-98 and novel miRNA gene GAM24.

[0148] Reference is now made to Fig. 12D, which is a Northern blot of a lysate experiment with MIR-98 and GAM24. Northern blot analysis of hairpins in EST72223 . Left, Northern reacted with predicted Mir-98 hairpin probe, Right, Northern reacted with predicted GAM24 hairpin probe. The molecular size of EST is indicated by arrow. The molecular sizes of Mir-98 and GAM24 are 80nt and 100nt, respectively as indicated by arrows. The 22nt molecular marker is indicated by arrow. 1-Hela lysate; 2-EST incubated 4h with Hela lysate; 3-EST without lysate; 4-Mir transcript incubated 4h with Hela lysate; 5-Mir transcript incubated overnight with Hela lysate; 6- Mir transcript without lysate; 7-RNA extracted from Hela cells following transfection with Mir transcript.

[0149] Technical methods used in experiments, the results of

which are depicted in Figs. 12B, 12C and 12D are as follows:

[0150] *Transcript preparations:* Digoxigenin (DIG) labeled transcripts were prepared from EST72223 (TIGER), MIR98 and predicted precursor hairpins by using a DIG RNA labeling kit (Roche Molecular Biochemicals) according to the manufacturer's protocol. Briefly, PCR products with T7 promoter at the 5' end or T3 promoter at the 3' end were prepared from each DNA in order to use it as a template to prepare sense and antisense transcripts, respectively. MIR-98 was amplified using EST72223 as a template with T7miR98 forward primer:

5'-TAATACGACTCACTATAGGGTGAGGTAGTAAGTTGTATTGTT-3' and T3miR98 reverse primer:

5'-AATTAACCCTCACTAAAGGGAAAGTAGTAAGTTGTATAGTT-3' EST72223 was amplified with T7-EST 72223 forward

primer: 5'-TAATACGACTCACTATAGGCCCTTATTAGAGGATTCTGCT-3' and T3-EST72223 reverse

primer: 5'-AATTAACCCTCACTAAAGGTTTTTTTTTCCTGAGACAGAGT-3' Bet-4 was amplified using EST72223 as a template with Bet-4 forward primer:

5'-GAGGCAGGAGAATTGCTTGA- 3' and T3-EST72223 reverse

primer:5"-AATTAACCCTCACTAAAGGCCTGAGACAGAGTCT
TGCTC-3"The PCR products were cleaned and used for
DIG-labeled or unlabeled transcription reactions with the
appropriate polymerase. For transfection experiments,
CAP reaction was performed by using a mMessage mMa-
chine kit (Ambion).

[0151] *Transfection procedure:* Transfection of Hela cells was per-
formed by using TransMessenger reagent (Qiagen) ac-
cording to the manufacture"s protocol. Briefly, Hela cells
were seeded to 1-2x 10⁶ cells per plate a day before
transfection. Two µg RNA transcripts were mixed with 8µl
Enhancer in a final volume of 100µl, mixed and incubated
at room temperature for 5 min. 16µl TransMessenger
reagent was added to the RNA-Enhancer, mixed and incu-
bated for additional 10 min. Cell plates were washed with
sterile PBS twice and then incubated with the transfection
mix diluted with 2.5ml DMEM medium without serum.
Cells were incubated with transfection mix for three hours
under their normal growth condition (37°C and 5% CO₂)
before the transfection mix was removed and a fresh
DMEM medium containing serum was added to the cells.
Cells were left to grow 48 hours before harvesting.

[0152] *Target RNA cleavage assay:* Cap-labeled target RNAs were

generated using mMessage mMachineTM (Ambion). Caped RNA transcripts were preincubated at 30⁰C for 15 min in supplemented Hela S100 obtained from Computer Cell Culture, Mos, Belgium. After addition of all components, final concentrations were 100mM target RNA, 1m M ATP, 0.2mM GTP, 10U/ml RNasin, 30µg/ml creatine kinase, 25mM creatine phosphate, and 50% S100 extract. Incubation was continued for 4 hours to overnight. Cleavage reaction was stopped by the addition of 8 volumes of proteinase K buffer (200Mm Tris-Hcl, pH 7.5, 25m M EDTA, 300mM NaCl, and 2% SDS). Proteinase K, dissolved in 50mM Tris-HCl, pH 8, 5m M CaCl₂, and 50% glycerol, was added to a final concentration of 0.6 mg/ml. Sample were subjected to phenol/chlorophorm extraction and kept frozen until analyzed by urea-TBE PAGE.

[0153] *Northern analysis:* RNAs were extracted from cells by using Tri-reagent according to the manufacture"s protocol. The RNAs were dissolved in water and heated to 650C to disrupt any association of the 25nt RNA with larger RNA molecules. RNA were placed on ice and incubated for 30 min with PEG (MW=8000) in a final concentration of 5% and NaCl in a final concentration of 0.5M to precipitate high molecular weight nucleic acid. The RNAs were cen-

trifuged at 10,000xg for 10 min to pellet the high molecular weight nucleic acid. The supernatant containing the low molecular weight RNAs was collected and three volumes of ethanol was added. The RNAs were placed at -200C for at least two hours and then centrifuged at 10,000xg for 10 min. The pellets were dissolved in Urea-TBE buffer (1Xtbe, 7M urea) for further analysis by a Northern blot.

[0154] RNA samples were boiled for 5 min before loading on 15%–8% polyacrylamide (19:1) gels containing 7M urea and 1xTBE. Gels were run in 1xTBE at a constant voltage of 300V and then transferred into a nylon membrane. The membrane was exposed to 3min ultraviolet light to cross link the RNAs to the membrane. Hybridization was performed overnight with DIG-labeled probes at 420C. Membranes were washed twice with SSCx2 and 0.2% SDS for 10 min. at 420C and then washed twice with SSCx0.5 for 5 min at room temperature. The membrane was then developed by using a DIG luminescent detection kit (Roche) using anti DIG and CSPD reaction, according to the manufacture"s protocol.

[0155] It is appreciated that the data presented in Figs. 12A, 12B, 12C and 12D, when taken together validate the function

of the bioinformatic gene detection engine 100 of Fig. 2. Fig. 12A shows a novel GAM gene bioinformatically detected by the bioinformatic gene detection engine 100, and Figs. 12B, 12C and 12D show laboratory confirmation of the expression of this novel gene. This is in accord with the engine training and validation methodology described hereinabove with reference to Fig. 3.

[0156] Reference is now made to Fig. 13A which is an annotated sequence of an EST comprising a novel gene detected by the gene detection system of the present invention. Fig. 13A shows the nucleotide sequence of a known human non-protein coding EST (Expressed Sequence Tag), identified as EST 7929020. It is appreciated that the sequence of this EST comprises sequences of two novel GAM genes, referred to here as GAM23 and GAM25, detected by the bioinformatic gene detection system of the present invention, described hereinabove with reference to Fig. 2.

[0157] Reference is now made to Fig. 13B which presents pictures of laboratory results, that demonstrate laboratory confirmation of expression of the bioinformatically detected novel gene of Fig. 13A. Northern blot analysis of hairpins in EST7929020. Left, Northern reacted with predicted GAM25 hairpin probe, Right, Northern reacted with

predicted GAM23 hairpin probe. The molecular size of EST is indicated by arrow. The molecular sizes of GAM23 and GAM25 are 60nt, as indicated by arrow. The 22nt molecular marker is indicated by arrow. 1–Hela lysate; 2– EST incubated 4h with Hela lysate ; 3– EST incubated overnight with Hela lysate; 4–EST without lysate; 5–GAM transcript; 6– GAM 22nt marker;7–GAM PCR probe; 8–RNA from control Hela cells; 9–RNA extracted from Hela cells following transfection with EST.

[0158] Reference is now made to Fig. 13C which is a picture of a Northern blot confirming Endogenous expression of bioinformatically detected gene GAM25 of Fig. 13A from in Hela cells. Northern was reacted with a predicted GAM25 hairpin probe. The molecular size of EST7929020 is indicated. The molecular sizes of GAM25 is 58nt, as indicated. A 19nt DNA oligo molecular marker is indicated. Endogenous expression of GAM25 in Hela total RNA fraction and in S–100 fraction is indicated by arrows.

1–GAM25 transcript; 2– GAM25 DNA oligo marker; 3–RNA from control Hela cells; 4–RNA extracted from Hela cells following transfection with EST; 5– RNA extracted from S–100 Hela lysate.

[0159] Reference is now made to Fig. 14A which is an annotated

sequence of an EST comprising a novel gene detected by the gene detection system of the present invention. Fig. 14A shows the nucleotide sequence of a known human non-protein coding EST (Expressed Sequence Tag), identified as EST 1388749. It is appreciated that the sequence of this EST comprises sequence of a novel GAM gene, referred to here as GAM26, detected by the bioinformatic gene detection system of the present invention, described hereinabove with reference to Fig. 2.

[0160] Reference is now made to Fig. 14B which is a picture of Northern blot analysis, confirming expression of novel bioinformatically detected gene GAM26, and natural processing thereof from EST1388749. Northern reacted with predicted GAM26 hairpin probe. The molecular size of EST is indicated by arrow. The molecular sizes of GAM26 is 130nt, as indicated by arrow. The 22nt molecular marker is indicated by arrow. 1-Hela lysate; 2-EST incubated 4h with Hela lysate; 3- EST incubated overnight with Hela lysate; 4-EST without lysate; 5-GAM transcript; 6- GAM 22nt marker; 7-GAM PCR probe.

[0161] Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger

15 (VGAM15) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[0162] VGAM15 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM15 was detected is described hereinabove with reference to Figs. 1–8.

[0163] VGAM15 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus. VGAM15 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[0164] VGAM15 gene encodes a VGAM15 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM15 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM15 precursor RNA is designated SEQ ID:1, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1 is located at position 190678 relative to the genome of Vaccinia Virus.

[0165] VGAM15 precursor RNA folds onto itself, forming VGAM15 folded precursor RNA, herein designated VGAM FOLDED

PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[0166] An enzyme complex designated DICER COMPLEX, `dices` the VGAM15 folded precursor RNA into VGAM15 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of VGAM15 RNA is designated SEQ ID:350, and is provided hereinbelow with reference to the sequence listing part.

[0167] VGAM15 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM15 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM15 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a

5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[0168] VGAM15 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM15 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM15 RNA is an accurate or a partial inverted-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM15 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM15 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR

region, or in both 3`UTR and 5`UTR regions.

[0169] The complementary binding of VGAM15 RNA, herein designated VGAM RNA, to host target binding sites on VGAM15 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM15 host target RNA into VGAM15 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[0170] It is appreciated that VGAM15 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM15 host target genes. The mRNA of each one of this plurality of VGAM15 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM15 RNA, herein designated VGAM RNA, and which when bound by VGAM15 RNA causes inhibition of translation of respective one or more VGAM15 host target proteins.

[0171] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM15 gene, herein designated VGAM GENE, on one or

more VGAM15 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[0172] It is yet further appreciated that a function of VGAM15 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM15 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM15 correlate with, and may be deduced from, the identity of the host target genes which VGAM15 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[0173] Nucleotide sequences of the VGAM15 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the
`diced` VGAM15 RNA, herein designated VGAM RNA, and
a schematic representation of the secondary folding of
VGAM15 folded precursor RNA, herein designated VGAM
FOLDED PRECURSOR RNA, of VGAM15 are further de-
scribed hereinbelow with reference to Table 1.

[0174] Nucleotide sequences of host target binding sites, such as
BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of
Fig. 1, found on VGAM15 host target RNA, and schematic
representation of the complementarity of each of these
host target binding sites to VGAM15 RNA, herein desig-
nated VGAM RNA, are described hereinbelow with refer-
ence to Table 2.

[0175] As mentioned hereinabove with reference to Fig. 1, a
function of VGAM15 gene, herein designated VGAM is in-
hibition of expression of VGAM15 target genes. It is ap-
preciated that specific functions, and accordingly utilities,
of VGAM15 correlate with, and may be deduced from, the
identity of the target genes which VGAM15 binds and in-
hibits, and the function of these target genes, as elabo-
rated hereinbelow.

[0176] Calpain 2, (m/II) Large Subunit (CAPN2, Accession
NM_001748) is a VGAM15 host target gene. CAPN2 BIND-

ING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CAPN2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CAPN2 BINDING SITE, designated SEQ ID:855, to the nucleotide sequence of VGAM15 RNA, herein designated VGAM RNA, also designated SEQ ID:350.

[0177] A function of VGAM15 is therefore inhibition of Calpain 2, (m/II) Large Subunit (CAPN2, Accession NM_001748). Accordingly, utilities of VGAM15 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CAPN2. Dishevelled Associated Activator of Morphogenesis 2 (DAAM2, Accession XM_166434) is another VGAM15 host target gene. DAAM2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DAAM2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DAAM2 BINDING SITE, designated SEQ ID:3559, to the nucleotide sequence of VGAM15 RNA, herein designated VGAM RNA, also designated SEQ ID:350.

[0178] Another function of VGAM15 is therefore inhibition of Dishevelled Associated Activator of Morphogenesis 2 (DAAM2, Accession XM_166434), a gene which controls cell polarity and movement during development. Accordingly, utilities of VGAM15 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DAAM2. The function of DAAM2 has been established by previous studies. By sequencing randomly selected cDNAs corresponding to relatively long transcripts from brain, Nagase et al. (1997) identified a cDNA which they designated KIAA0381. The KIAA0381 cDNA encodes an 864-amino acid protein predicted to be involved in cell division. RT-PCR analysis detected expression of KIAA0381 in most tissues tested. Wnt (see OMIM Ref. No. 164975) signaling via the frizzled receptor (Fz; OMIM Ref. No. 600667) controls cell polarity and movement during development. Habas et al. (2001) reported that in human cells and during *Xenopus* embryogenesis, Wnt/Fz signaling activates the small GTPase Rho (OMIM Ref. No. 165390), a key regulator of cytoskeleton architecture. Wnt/Fz activation of Rho requires the cytoplasmic protein dishevelled (DVL; OMIM Ref. No. 601365) and a novel formin (see OMIM Ref. No. 136535) homology (FH)

protein that they identified and named DAAM1 (OMIM Ref. No. 606626). Habas et al. (2001) identified DAAM2, which is identical to KIAA0381, as a protein that is closely related to DAAM1.

[0179] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[0180] Habas, R.; Kato, Y.; He, X. : Wnt/Frizzled activation of Rho regulates vertebrate gastrulation and requires a novel Formin homology protein Daam1. Cell 107: 843–854, 2001. ; and

[0181] Nagase, T.; Ishikawa, K.; Nakajima, D.; Ohira, M.; Seki, N.; Miyajima, N.; Tanaka, A.; Kotani, H.; Nomura, N.; Ohara, O. : Prediction of the coding sequences of unidentified human gene.

[0182] Further studies establishing the function and utilities of DAAM2 are found in John Hopkins OMIM database record ID 606627, and in cited publications numbered 1012 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Selectin E (endothelial adhesion molecule 1) (SELE, Accession NM_000450) is another VGAM15 host target gene. SELE BINDING SITE is HOST TARGET binding site found in the

3' untranslated region of mRNA encoded by SELE, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SELE BINDING SITE, designated SEQ ID:747, to the nucleotide sequence of VGAM15 RNA, herein designated VGAM RNA, also designated SEQ ID:350.

[0183] Another function of VGAM15 is therefore inhibition of Selectin E (endothelial adhesion molecule 1) (SELE, Accession NM_000450), a gene which expressed on cytokine induced endothelial cells and mediates their binding to leukocytes. Accordingly, utilities of VGAM15 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SELE. The function of SELE has been established by previous studies. Zheng et al. (2001) examined whether a polymorphism in the SELE gene, due to a G-to-T mutation (98G-T) in the untranslated region of exon 2, was related to premature coronary artery disease (CAD). Both lipid and nonlipid risk factors, including the ser128-to-arg substitution studied by Wenzel et al. (1994), were also assessed. The frequency of the 98G-T mutation was found to be significantly increased among male patients under 45 years of age and female patients

under 55 years of age. After controlling for other CAD risk factors by multiple logistic analysis, the 98G-T mutation was still a significant predictor of premature CAD. The glaucomas are a group of optic neuropathies comprising the leading cause of irreversible blindness worldwide. Elevated intraocular pressure due to a reduction in normal aqueous outflow is a major causal risk factor. Wang et al. (2001) found that ELAM1, the earliest marker for the atherosclerotic plaque in the vasculature, was consistently present on trabecular meshwork cells in the outflow pathways of eyes with glaucomas of diverse etiology. They determined expression of ELAM1 to be controlled by activation of an interleukin-1 (see OMIM Ref. No. 147760) autocrine feedback loop through transcription factor NK-kappa-B (see OMIM Ref. No. 164011), and activity of this signaling pathway was shown to protect trabecular meshwork cells against oxidative stress. Wang et al. (2001) concluded that their findings characterized a protective stress response specific to the eye's aqueous outflow pathways and provided the first known diagnostic indicator of glaucomatous trabecular meshwork cells. They further indicated that common mechanisms contribute to the pathophysiology of the glaucomas and vascular diseases.

[0184] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[0185] Wang, N.; Chintala, S. K.; Fini, M. E.; Schuman, J. S. : Activation of a tissue-specific stress response in the aqueous outflow pathway of the eye defines the glaucoma disease phenotype. *Nature Med.* 7: 304–309, 2001. ; and

[0186] Zheng, F.; Chevalier, J. A.; Zhang, L. Q.; Virgil, D.; Ye, S. Q.; Kwiterovich, P. O. : An HphI polymorphism in the E-selectin gene is associated with premature coronary artery diseases.

[0187] Further studies establishing the function and utilities of SELE are found in John Hopkins OMIM database record ID 131210, and in cited publications numbered 2722–2729 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. KIAA0475 (Accession NM_014864) is another VGAM15 host target gene. KIAA0475 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0475, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0475 BINDING SITE, designated

SEQ ID:1570, to the nucleotide sequence of VGAM15 RNA, herein designated VGAM RNA, also designated SEQ ID:350.

[0188] Another function of VGAM15 is therefore inhibition of KIAA0475 (Accession NM_014864). Accordingly, utilities of VGAM15 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0475. LOC222671 (Accession XM_167094) is another VGAM15 host target gene. LOC222671 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC222671, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222671 BINDING SITE, designated SEQ ID:3582, to the nucleotide sequence of VGAM15 RNA, herein designated VGAM RNA, also designated SEQ ID:350.

[0189] Another function of VGAM15 is therefore inhibition of LOC222671 (Accession XM_167094). Accordingly, utilities of VGAM15 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222671. LOC254901 (Accession XM_171878) is another VGAM15 host target gene. LOC254901 BINDING

SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC254901, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254901 BINDING SITE, designated SEQ ID:3699, to the nucleotide sequence of VGAM15 RNA, herein designated VGAM RNA, also designated SEQ ID:350.

[0190] Another function of VGAM15 is therefore inhibition of LOC254901 (Accession XM_171878). Accordingly, utilities of VGAM15 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254901. LOC257615 (Accession XM_175293) is another VGAM15 host target gene. LOC257615 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC257615, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257615 BINDING SITE, designated SEQ ID:3749, to the nucleotide sequence of VGAM15 RNA, herein designated VGAM RNA, also designated SEQ ID:350.

[0191] Another function of VGAM15 is therefore inhibition of

LOC257615 (Accession XM_175293). Accordingly, utilities of VGAM15 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257615. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 16 (VGAM16) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[0192] VGAM16 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM16 was detected is described hereinabove with reference to Figs. 1–8.

[0193] VGAM16 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus. VGAM16 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[0194] VGAM16 gene encodes a VGAM16 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM16 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide se–

quence of VGAM16 precursor RNA is designated SEQ ID:2, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:2 is located at position 188927 relative to the genome of Vaccinia Virus.

[0195] VGAM16 precursor RNA folds onto itself, forming VGAM16 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[0196] An enzyme complex designated DICER COMPLEX, `dices` the VGAM16 folded precursor RNA into VGAM16 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of VGAM16 RNA is designated SEQ ID:351, and is

provided hereinbelow with reference to the sequence listing part.

[0197] VGAM16 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM16 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM16 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[0198] VGAM16 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM16 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM16 RNA is an accurate or a partial inverted-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM16 RNA,

herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM16 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR and 5' UTR regions.

[0199] The complementary binding of VGAM16 RNA, herein designated VGAM RNA, to host target binding sites on VGAM16 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM16 host target RNA into VGAM16 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[0200] It is appreciated that VGAM16 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM16 host target genes. The mRNA of each one of this plurality of VGAM16 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM16 RNA, herein designated VGAM

RNA, and which when bound by VGAM16 RNA causes inhibition of translation of respective one or more VGAM16 host target proteins.

[0201] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM16 gene, herein designated VGAM GENE, on one or more VGAM16 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[0202] It is yet further appreciated that a function of VGAM16 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM16 include diagnosis, prevention and

treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM16 correlate with, and may be deduced from, the identity of the host target genes which VGAM16 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[0203] Nucleotide sequences of the VGAM16 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM16 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM16 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM16 are further described hereinbelow with reference to Table 1.

[0204] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM16 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM16 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[0205] As mentioned hereinabove with reference to Fig. 1, a function of VGAM16 gene, herein designated VGAM is inhibition of expression of VGAM16 target genes. It is ap-

preciated that specific functions, and accordingly utilities, of VGAM16 correlate with, and may be deduced from, the identity of the target genes which VGAM16 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[0206] Calpain 2, (m/II) Large Subunit (CAPN2, Accession NM_001748) is a VGAM16 host target gene. CAPN2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CAPN2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CAPN2 BINDING SITE, designated SEQ ID:855, to the nucleotide sequence of VGAM16 RNA, herein designated VGAM RNA, also designated SEQ ID:351.

[0207] A function of VGAM16 is therefore inhibition of Calpain 2, (m/II) Large Subunit (CAPN2, Accession NM_001748). Accordingly, utilities of VGAM16 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CAPN2. Dishevelled Associated Activator of Morphogenesis 2 (DAAM2, Accession XM_166434) is another VGAM16 host target gene. DAAM2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by DAAM2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DAAM2 BINDING SITE, designated SEQ ID:3559, to the nucleotide sequence of VGAM16 RNA, herein designated VGAM RNA, also designated SEQ ID:351.

[0208] Another function of VGAM16 is therefore inhibition of Dishevelled Associated Activator of Morphogenesis 2 (DAAM2, Accession XM_166434), a gene which controls cell polarity and movement during development. Accordingly, utilities of VGAM16 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DAAM2. The function of DAAM2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM15. Selectin E (endothelial adhesion molecule 1) (SELE, Accession NM_000450) is another VGAM16 host target gene. SELE BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SELE, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of SELE BINDING SITE, designated SEQ ID:747, to the nucleotide sequence of VGAM16 RNA, herein designated VGAM RNA, also designated SEQ ID:351.

[0209] Another function of VGAM16 is therefore inhibition of Selectin E (endothelial adhesion molecule 1) (SELE, Accession NM_000450), a gene which expressed on cytokine induced endothelial cells and mediates their binding to leukocytes. Accordingly, utilities of VGAM16 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SELE. The function of SELE and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM15. KIAA0475 (Accession NM_014864) is another VGAM16 host target gene. KIAA0475 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0475, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0475 BINDING SITE, designated SEQ ID:1570, to the nucleotide sequence of VGAM16 RNA, herein designated VGAM RNA, also designated SEQ

ID:351.

[0210] Another function of VGAM16 is therefore inhibition of KIAA0475 (Accession NM_014864). Accordingly, utilities of VGAM16 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0475. LOC222671 (Accession XM_167094) is another VGAM16 host target gene. LOC222671 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC222671, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222671 BINDING SITE, designated SEQ ID:3582, to the nucleotide sequence of VGAM16 RNA, herein designated VGAM RNA, also designated SEQ ID:351.

[0211] Another function of VGAM16 is therefore inhibition of LOC222671 (Accession XM_167094). Accordingly, utilities of VGAM16 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222671. LOC254901 (Accession XM_171878) is another VGAM16 host target gene. LOC254901 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC254901, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254901 BINDING SITE, designated SEQ ID:3699, to the nucleotide sequence of VGAM16 RNA, herein designated VGAM RNA, also designated SEQ ID:351.

[0212] Another function of VGAM16 is therefore inhibition of LOC254901 (Accession XM_171878). Accordingly, utilities of VGAM16 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254901. LOC257615 (Accession XM_175293) is another VGAM16 host target gene. LOC257615 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC257615, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257615 BINDING SITE, designated SEQ ID:3749, to the nucleotide sequence of VGAM16 RNA, herein designated VGAM RNA, also designated SEQ ID:351.

[0213] Another function of VGAM16 is therefore inhibition of LOC257615 (Accession XM_175293). Accordingly, utilities of VGAM16 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LOC257615. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 17 (VGAM17) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[0214] VGAM17 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM17 was detected is described hereinabove with reference to Figs. 1–8.

[0215] VGAM17 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus. VGAM17 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[0216] VGAM17 gene encodes a VGAM17 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM17 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM17 precursor RNA is designated SEQ ID:3, and is provided hereinbelow with reference to the se–

quence listing part. Nucleotide sequence SEQ ID:3 is located at position 188927 relative to the genome of Vaccinia Virus.

[0217] VGAM17 precursor RNA folds onto itself, forming VGAM17 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[0218] An enzyme complex designated DICER COMPLEX, `dices` the VGAM17 folded precursor RNA into VGAM17 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of VGAM17 RNA is designated SEQ ID:352, and is provided hereinbelow with reference to the sequence listing part.

[0219] VGAM17 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM17 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM17 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[0220] VGAM17 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM17 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM17 RNA is an accurate or a partial inverted-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM17 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of

a VGAM17 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR and 5' UTR regions.

[0221] The complementary binding of VGAM17 RNA, herein designated VGAM RNA, to host target binding sites on VGAM17 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM17 host target RNA into VGAM17 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[0222] It is appreciated that VGAM17 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM17 host target genes. The mRNA of each one of this plurality of VGAM17 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM17 RNA, herein designated VGAM RNA, and which when bound by VGAM17 RNA causes inhibition of translation of respective one or more VGAM17

host target proteins.

[0223] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM17 gene, herein designated VGAM GENE, on one or more VGAM17 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[0224] It is yet further appreciated that a function of VGAM17 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM17 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM17 correlate

with, and may be deduced from, the identity of the host target genes which VGAM17 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[0225] Nucleotide sequences of the VGAM17 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM17 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM17 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM17 are further described hereinbelow with reference to Table 1.

[0226] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM17 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM17 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[0227] As mentioned hereinabove with reference to Fig. 1, a function of VGAM17 gene, herein designated VGAM is inhibition of expression of VGAM17 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM17 correlate with, and may be deduced from, the

identity of the target genes which VGAM17 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[0228] Calpain 2, (m/II) Large Subunit (CAPN2, Accession NM_001748) is a VGAM17 host target gene. CAPN2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CAPN2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CAPN2 BINDING SITE, designated SEQ ID:855, to the nucleotide sequence of VGAM17 RNA, herein designated VGAM RNA, also designated SEQ ID:352.

[0229] A function of VGAM17 is therefore inhibition of Calpain 2, (m/II) Large Subunit (CAPN2, Accession NM_001748). Accordingly, utilities of VGAM17 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CAPN2. Dishevelled Associated Activator of Morphogenesis 2 (DAAM2, Accession XM_166434) is another VGAM17 host target gene. DAAM2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DAAM2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DAAM2 BINDING SITE, designated SEQ ID:3559, to the nucleotide sequence of VGAM17 RNA, herein designated VGAM RNA, also designated SEQ ID:352.

[0230] Another function of VGAM17 is therefore inhibition of Dishevelled Associated Activator of Morphogenesis 2 (DAAM2, Accession XM_166434), a gene which controls cell polarity and movement during development. Accordingly, utilities of VGAM17 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DAAM2. The function of DAAM2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM15. Selectin E (endothelial adhesion molecule 1) (SELE, Accession NM_000450) is another VGAM17 host target gene. SELE BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SELE, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SELE BINDING SITE, designated SEQ ID:747, to the nucleotide sequence

of VGAM17 RNA, herein designated VGAM RNA, also designated SEQ ID:352.

[0231] Another function of VGAM17 is therefore inhibition of Selectin E (endothelial adhesion molecule 1) (SELE, Accession NM_000450), a gene which expressed on cytokine induced endothelial cells and mediates their binding to leukocytes. Accordingly, utilities of VGAM17 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SELE. The function of SELE and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM15. KIAA0475 (Accession NM_014864) is another VGAM17 host target gene. KIAA0475 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0475, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0475 BINDING SITE, designated SEQ ID:1570, to the nucleotide sequence of VGAM17 RNA, herein designated VGAM RNA, also designated SEQ ID:352.

[0232] Another function of VGAM17 is therefore inhibition of

KIAA0475 (Accession NM_014864). Accordingly, utilities of VGAM17 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0475. LOC222671 (Accession XM_167094) is another VGAM17 host target gene. LOC222671 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC222671, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222671 BINDING SITE, designated SEQ ID:3582, to the nucleotide sequence of VGAM17 RNA, herein designated VGAM RNA, also designated SEQ ID:352.

[0233] Another function of VGAM17 is therefore inhibition of LOC222671 (Accession XM_167094). Accordingly, utilities of VGAM17 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222671. LOC254901 (Accession XM_171878) is another VGAM17 host target gene. LOC254901 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC254901, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC254901 BINDING SITE, designated SEQ ID:3699, to the nucleotide sequence of VGAM17 RNA, herein designated VGAM RNA, also designated SEQ ID:352.

[0234] Another function of VGAM17 is therefore inhibition of LOC254901 (Accession XM_171878). Accordingly, utilities of VGAM17 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254901. LOC257615 (Accession XM_175293) is another VGAM17 host target gene. LOC257615 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC257615, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257615 BINDING SITE, designated SEQ ID:3749, to the nucleotide sequence of VGAM17 RNA, herein designated VGAM RNA, also designated SEQ ID:352.

[0235] Another function of VGAM17 is therefore inhibition of LOC257615 (Accession XM_175293). Accordingly, utilities of VGAM17 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257615. Fig. 1 further provides a conceptual descrip-

tion of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 18 (VGAM18) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[0236] VGAM18 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM18 was detected is described hereinabove with reference to Figs. 1–8.

[0237] VGAM18 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus. VGAM18 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[0238] VGAM18 gene encodes a VGAM18 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM18 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM18 precursor RNA is designated SEQ ID:4, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:4 is located at position 188927 relative to the genome of Vac–

cinia Virus.

[0239] VGAM18 precursor RNA folds onto itself, forming VGAM18 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[0240] An enzyme complex designated DICER COMPLEX, `dices` the VGAM18 folded precursor RNA into VGAM18 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of VGAM18 RNA is designated SEQ ID:353, and is provided hereinbelow with reference to the sequence listing part.

[0241] VGAM18 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA,

VGAM18 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM18 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[0242] VGAM18 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM18 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM18 RNA is an accurate or a partial inverted-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM18 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM18 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig.

1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR and 5' UTR regions.

[0243] The complementary binding of VGAM18 RNA, herein designated VGAM RNA, to host target binding sites on VGAM18 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM18 host target RNA into VGAM18 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[0244] It is appreciated that VGAM18 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM18 host target genes. The mRNA of each one of this plurality of VGAM18 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM18 RNA, herein designated VGAM RNA, and which when bound by VGAM18 RNA causes inhibition of translation of respective one or more VGAM18 host target proteins.

[0245] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM18 gene, herein designated VGAM GENE, on one or more VGAM18 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[0246] It is yet further appreciated that a function of VGAM18 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM18 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM18 correlate with, and may be deduced from, the identity of the host target genes which VGAM18 binds and inhibits, and the

function of these host target genes, as elaborated herein–below.

[0247] Nucleotide sequences of the VGAM18 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM18 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM18 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM18 are further described hereinbelow with reference to Table 1.

[0248] Nucleotide sequences of host target binding sites, such as BINDING SITE–I, BINDING SITE–II and BINDING SITE–III of Fig. 1, found on VGAM18 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM18 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[0249] As mentioned hereinabove with reference to Fig. 1, a function of VGAM18 gene, herein designated VGAM is inhibition of expression of VGAM18 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM18 correlate with, and may be deduced from, the identity of the target genes which VGAM18 binds and inhibits, and the function of these target genes, as elabo–

rated hereinbelow.

[0250] Calpain 2, (m/II) Large Subunit (CAPN2, Accession NM_001748) is a VGAM18 host target gene. CAPN2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CAPN2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CAPN2 BINDING SITE, designated SEQ ID:855, to the nucleotide sequence of VGAM18 RNA, herein designated VGAM RNA, also designated SEQ ID:353.

[0251] A function of VGAM18 is therefore inhibition of Calpain 2, (m/II) Large Subunit (CAPN2, Accession NM_001748). Accordingly, utilities of VGAM18 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CAPN2. Dishevelled Associated Activator of Morphogenesis 2 (DAAM2, Accession XM_166434) is another VGAM18 host target gene. DAAM2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DAAM2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DAAM2 BIND-

ING SITE, designated SEQ ID:3559, to the nucleotide sequence of VGAM18 RNA, herein designated VGAM RNA, also designated SEQ ID:353.

[0252] Another function of VGAM18 is therefore inhibition of Dishevelled Associated Activator of Morphogenesis 2 (DAAM2, Accession XM_166434), a gene which controls cell polarity and movement during development. Accordingly, utilities of VGAM18 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DAAM2. The function of DAAM2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM15. Selectin E (endothelial adhesion molecule 1) (SELE, Accession NM_000450) is another VGAM18 host target gene. SELE BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SELE, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SELE BINDING SITE, designated SEQ ID:747, to the nucleotide sequence of VGAM18 RNA, herein designated VGAM RNA, also designated SEQ ID:353.

[0253] Another function of VGAM18 is therefore inhibition of Selectin E (endothelial adhesion molecule 1) (SELE, Accession NM_000450), a gene which expressed on cytokine induced endothelial cells and mediates their binding to leukocytes. Accordingly, utilities of VGAM18 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SELE. The function of SELE and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM15. KIAA0475 (Accession NM_014864) is another VGAM18 host target gene. KIAA0475 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0475, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0475 BINDING SITE, designated SEQ ID:1570, to the nucleotide sequence of VGAM18 RNA, herein designated VGAM RNA, also designated SEQ ID:353.

[0254] Another function of VGAM18 is therefore inhibition of KIAA0475 (Accession NM_014864). Accordingly, utilities of VGAM18 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with KIAA0475. LOC222671 (Accession XM_167094) is another VGAM18 host target gene. LOC222671 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC222671, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222671 BINDING SITE, designated SEQ ID:3582, to the nucleotide sequence of VGAM18 RNA, herein designated VGAM RNA, also designated SEQ ID:353.

[0255] Another function of VGAM18 is therefore inhibition of LOC222671 (Accession XM_167094). Accordingly, utilities of VGAM18 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222671. LOC254901 (Accession XM_171878) is another VGAM18 host target gene. LOC254901 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC254901, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254901 BINDING SITE, designated SEQ ID:3699, to

the nucleotide sequence of VGAM18 RNA, herein designated VGAM RNA, also designated SEQ ID:353.

[0256] Another function of VGAM18 is therefore inhibition of LOC254901 (Accession XM_171878). Accordingly, utilities of VGAM18 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254901. LOC257615 (Accession XM_175293) is another VGAM18 host target gene. LOC257615 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC257615, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257615 BINDING SITE, designated SEQ ID:3749, to the nucleotide sequence of VGAM18 RNA, herein designated VGAM RNA, also designated SEQ ID:353.

[0257] Another function of VGAM18 is therefore inhibition of LOC257615 (Accession XM_175293). Accordingly, utilities of VGAM18 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257615. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Ad-

dress Messenger 19 (VGAM19) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[0258] VGAM19 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM19 was detected is described hereinabove with reference to Figs. 1–8.

[0259] VGAM19 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus. VGAM19 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[0260] VGAM19 gene encodes a VGAM19 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM19 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM19 precursor RNA is designated SEQ ID:5, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:5 is located at position 188927 relative to the genome of Vaccinia Virus.

[0261] VGAM19 precursor RNA folds onto itself, forming VGAM19

folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[0262] An enzyme complex designated DICER COMPLEX, `dices` the VGAM19 folded precursor RNA into VGAM19 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of VGAM19 RNA is designated SEQ ID:354, and is provided hereinbelow with reference to the sequence listing part.

[0263] VGAM19 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM19 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM19 host target RNA comprises three

regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[0264] VGAM19 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM19 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM19 RNA is an accurate or a partial inverted-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM19 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM19 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target bind-

ing sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[0265] The complementary binding of VGAM19 RNA, herein designated VGAM RNA, to host target binding sites on VGAM19 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM19 host target RNA into VGAM19 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[0266] It is appreciated that VGAM19 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM19 host target genes. The mRNA of each one of this plurality of VGAM19 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM19 RNA, herein designated VGAM RNA, and which when bound by VGAM19 RNA causes inhibition of translation of respective one or more VGAM19 host target proteins.

[0267] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM19 gene, herein designated VGAM GENE, on one or more VGAM19 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[0268] It is yet further appreciated that a function of VGAM19 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM19 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM19 correlate with, and may be deduced from, the identity of the host target genes which VGAM19 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[0269] Nucleotide sequences of the VGAM19 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM19 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM19 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM19 are further described hereinbelow with reference to Table 1.

[0270] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM19 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM19 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[0271] As mentioned hereinabove with reference to Fig. 1, a function of VGAM19 gene, herein designated VGAM is inhibition of expression of VGAM19 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM19 correlate with, and may be deduced from, the identity of the target genes which VGAM19 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[0272] Calpain 2, (m/II) Large Subunit (CAPN2, Accession

NM_001748) is a VGAM19 host target gene. CAPN2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CAPN2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CAPN2 BINDING SITE, designated SEQ ID:855, to the nucleotide sequence of VGAM19 RNA, herein designated VGAM RNA, also designated SEQ ID:354.

[0273] A function of VGAM19 is therefore inhibition of Calpain 2, (m/II) Large Subunit (CAPN2, Accession NM_001748). Accordingly, utilities of VGAM19 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CAPN2. Dishevelled Associated Activator of Morphogenesis 2 (DAAM2, Accession XM_166434) is another VGAM19 host target gene. DAAM2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DAAM2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DAAM2 BINDING SITE, designated SEQ ID:3559, to the nucleotide sequence of VGAM19 RNA, herein designated VGAM RNA,

also designated SEQ ID:354.

[0274] Another function of VGAM19 is therefore inhibition of Dishevelled Associated Activator of Morphogenesis 2 (DAAM2, Accession XM_166434), a gene which controls cell polarity and movement during development. Accordingly, utilities of VGAM19 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DAAM2. The function of DAAM2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM15. Selectin E (endothelial adhesion molecule 1) (SELE, Accession NM_000450) is another VGAM19 host target gene. SELE BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SELE, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SELE BINDING SITE, designated SEQ ID:747, to the nucleotide sequence of VGAM19 RNA, herein designated VGAM RNA, also designated SEQ ID:354.

[0275] Another function of VGAM19 is therefore inhibition of Selectin E (endothelial adhesion molecule 1) (SELE, Accession

NM_000450), a gene which expressed on cytokine induced endothelial cells and mediates their binding to leukocytes. Accordingly, utilities of VGAM19 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SELE. The function of SELE and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM15. KIAA0475 (Accession NM_014864) is another VGAM19 host target gene. KIAA0475 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0475, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0475 BINDING SITE, designated SEQ ID:1570, to the nucleotide sequence of VGAM19 RNA, herein designated VGAM RNA, also designated SEQ ID:354.

[0276] Another function of VGAM19 is therefore inhibition of KIAA0475 (Accession NM_014864). Accordingly, utilities of VGAM19 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0475. LOC222671 (Accession XM_167094) is another

VGAM19 host target gene. LOC222671 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC222671, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222671 BINDING SITE, designated SEQ ID:3582, to the nucleotide sequence of VGAM19 RNA, herein designated VGAM RNA, also designated SEQ ID:354.

[0277] Another function of VGAM19 is therefore inhibition of LOC222671 (Accession XM_167094). Accordingly, utilities of VGAM19 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222671. LOC254901 (Accession XM_171878) is another VGAM19 host target gene. LOC254901 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC254901, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254901 BINDING SITE, designated SEQ ID:3699, to the nucleotide sequence of VGAM19 RNA, herein designated VGAM RNA, also designated SEQ ID:354.

[0278] Another function of VGAM19 is therefore inhibition of LOC254901 (Accession XM_171878). Accordingly, utilities of VGAM19 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254901. LOC257615 (Accession XM_175293) is another VGAM19 host target gene. LOC257615 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC257615, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257615 BINDING SITE, designated SEQ ID:3749, to the nucleotide sequence of VGAM19 RNA, herein designated VGAM RNA, also designated SEQ ID:354.

[0279] Another function of VGAM19 is therefore inhibition of LOC257615 (Accession XM_175293). Accordingly, utilities of VGAM19 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257615. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 20 (VGAM20) viral gene, which modulates expression of respective host target genes thereof,

the function and utility of which host target genes is known in the art.

[0280] VGAM20 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM20 was detected is described hereinabove with reference to Figs. 1–8.

[0281] VGAM20 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus. VGAM20 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[0282] VGAM20 gene encodes a VGAM20 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM20 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM20 precursor RNA is designated SEQ ID:6, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:6 is located at position 188927 relative to the genome of Vaccinia Virus.

[0283] VGAM20 precursor RNA folds onto itself, forming VGAM20 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[0284] An enzyme complex designated DICER COMPLEX, `dices` the VGAM20 folded precursor RNA into VGAM20 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of VGAM20 RNA is designated SEQ ID:355, and is provided hereinbelow with reference to the sequence listing part.

[0285] VGAM20 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM20 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM20 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3`

untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[0286] VGAM20 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM20 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM20 RNA is an accurate or a partial inverted-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM20 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM20 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[0287] The complementary binding of VGAM20 RNA, herein designated VGAM RNA, to host target binding sites on VGAM20 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM20 host target RNA into VGAM20 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[0288] It is appreciated that VGAM20 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM20 host target genes. The mRNA of each one of this plurality of VGAM20 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM20 RNA, herein designated VGAM RNA, and which when bound by VGAM20 RNA causes inhibition of translation of respective one or more VGAM20 host target proteins.

[0289] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM20 gene, herein designated VGAM GENE, on one or more VGAM20 host target gene, herein designated VGAM

HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[0290] It is yet further appreciated that a function of VGAM20 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM20 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM20 correlate with, and may be deduced from, the identity of the host target genes which VGAM20 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[0291] Nucleotide sequences of the VGAM20 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

`diced` VGAM20 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM20 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM20 are further described hereinbelow with reference to Table 1.

[0292] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM20 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM20 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[0293] As mentioned hereinabove with reference to Fig. 1, a function of VGAM20 gene, herein designated VGAM is inhibition of expression of VGAM20 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM20 correlate with, and may be deduced from, the identity of the target genes which VGAM20 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[0294] Calpain 2, (m/II) Large Subunit (CAPN2, Accession NM_001748) is a VGAM20 host target gene. CAPN2 BINDING SITE is HOST TARGET binding site found in the 3` un-

translated region of mRNA encoded by CAPN2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CAPN2 BINDING SITE, designated SEQ ID:855, to the nucleotide sequence of VGAM20 RNA, herein designated VGAM RNA, also designated SEQ ID:355.

[0295] A function of VGAM20 is therefore inhibition of Calpain 2, (m/II) Large Subunit (CAPN2, Accession NM_001748). Accordingly, utilities of VGAM20 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CAPN2. Dishevelled Associated Activator of Morphogenesis 2 (DAAM2, Accession XM_166434) is another VGAM20 host target gene. DAAM2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DAAM2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DAAM2 BINDING SITE, designated SEQ ID:3559, to the nucleotide sequence of VGAM20 RNA, herein designated VGAM RNA, also designated SEQ ID:355.

[0296] Another function of VGAM20 is therefore inhibition of Di-

shevelled Associated Activator of Morphogenesis 2 (DAAM2, Accession XM_166434), a gene which controls cell polarity and movement during development. Accordingly, utilities of VGAM20 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DAAM2. The function of DAAM2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM15. Selectin E (endothelial adhesion molecule 1) (SELE, Accession NM_000450) is another VGAM20 host target gene. SELE BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SELE, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SELE BINDING SITE, designated SEQ ID:747, to the nucleotide sequence of VGAM20 RNA, herein designated VGAM RNA, also designated SEQ ID:355.

[0297] Another function of VGAM20 is therefore inhibition of Selectin E (endothelial adhesion molecule 1) (SELE, Accession NM_000450), a gene which expressed on cytokine induced endothelial cells and mediates their binding to

leukocytes. Accordingly, utilities of VGAM20 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SELE. The function of SELE and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM15. KIAA0475 (Accession NM_014864) is another VGAM20 host target gene. KIAA0475 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0475, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0475 BINDING SITE, designated SEQ ID:1570, to the nucleotide sequence of VGAM20 RNA, herein designated VGAM RNA, also designated SEQ ID:355.

[0298] Another function of VGAM20 is therefore inhibition of KIAA0475 (Accession NM_014864). Accordingly, utilities of VGAM20 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0475. LOC222671 (Accession XM_167094) is another VGAM20 host target gene. LOC222671 BINDING SITE is HOST TARGET binding site found in the 5' untranslated

region of mRNA encoded by LOC222671, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222671 BINDING SITE, designated SEQ ID:3582, to the nucleotide sequence of VGAM20 RNA, herein designated VGAM RNA, also designated SEQ ID:355.

[0299] Another function of VGAM20 is therefore inhibition of LOC222671 (Accession XM_167094). Accordingly, utilities of VGAM20 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222671. LOC254901 (Accession XM_171878) is another VGAM20 host target gene. LOC254901 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC254901, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254901 BINDING SITE, designated SEQ ID:3699, to the nucleotide sequence of VGAM20 RNA, herein designated VGAM RNA, also designated SEQ ID:355.

[0300] Another function of VGAM20 is therefore inhibition of LOC254901 (Accession XM_171878). Accordingly, utilities

of VGAM20 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254901. LOC257615 (Accession XM_175293) is another VGAM20 host target gene. LOC257615 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC257615, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257615 BINDING SITE, designated SEQ ID:3749, to the nucleotide sequence of VGAM20 RNA, herein designated VGAM RNA, also designated SEQ ID:355.

[0301] Another function of VGAM20 is therefore inhibition of LOC257615 (Accession XM_175293). Accordingly, utilities of VGAM20 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257615. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 21 (VGAM21) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[0302] VGAM21 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM21 was detected is described hereinabove with reference to Figs. 1–8.

[0303] VGAM21 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus. VGAM21 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[0304] VGAM21 gene encodes a VGAM21 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM21 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM21 precursor RNA is designated SEQ ID:7, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:7 is located at position 188927 relative to the genome of Vaccinia Virus.

[0305] VGAM21 precursor RNA folds onto itself, forming VGAM21 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is

due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[0306] An enzyme complex designated DICER COMPLEX, `dices` the VGAM21 folded precursor RNA into VGAM21 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of VGAM21 RNA is designated SEQ ID:356, and is provided hereinbelow with reference to the sequence listing part.

[0307] VGAM21 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM21 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM21 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[0308] VGAM21 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM21 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM21 RNA is an accurate or a partial inverted-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM21 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM21 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR and 5' UTR regions.

[0309] The complementary binding of VGAM21 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM21 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM21 host target RNA into VGAM21 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[0310] It is appreciated that VGAM21 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM21 host target genes. The mRNA of each one of this plurality of VGAM21 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM21 RNA, herein designated VGAM RNA, and which when bound by VGAM21 RNA causes inhibition of translation of respective one or more VGAM21 host target proteins.

[0311] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM21 gene, herein designated VGAM GENE, on one or more VGAM21 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with

reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[0312] It is yet further appreciated that a function of VGAM21 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM21 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM21 correlate with, and may be deduced from, the identity of the host target genes which VGAM21 binds and inhibits, and the function of these host target genes, as elaborated herein-below.

[0313] Nucleotide sequences of the VGAM21 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM21 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of

VGAM21 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM21 are further described hereinbelow with reference to Table 1.

[0314] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM21 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM21 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[0315] As mentioned hereinabove with reference to Fig. 1, a function of VGAM21 gene, herein designated VGAM is inhibition of expression of VGAM21 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM21 correlate with, and may be deduced from, the identity of the target genes which VGAM21 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[0316] Calpain 2, (m/II) Large Subunit (CAPN2, Accession NM_001748) is a VGAM21 host target gene. CAPN2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CAPN2, corresponding to a HOST TARGET binding site such as BINDING

SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CAPN2 BINDING SITE, designated SEQ ID:855, to the nucleotide sequence of VGAM21 RNA, herein designated VGAM RNA, also designated SEQ ID:356.

[0317] A function of VGAM21 is therefore inhibition of Calpain 2, (m/II) Large Subunit (CAPN2, Accession NM_001748). Accordingly, utilities of VGAM21 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CAPN2. Dishevelled Associated Activator of Morphogenesis 2 (DAAM2, Accession XM_166434) is another VGAM21 host target gene. DAAM2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DAAM2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DAAM2 BINDING SITE, designated SEQ ID:3559, to the nucleotide sequence of VGAM21 RNA, herein designated VGAM RNA, also designated SEQ ID:356.

[0318] Another function of VGAM21 is therefore inhibition of Dishevelled Associated Activator of Morphogenesis 2 (DAAM2, Accession XM_166434), a gene which controls

cell polarity and movement during development. Accordingly, utilities of VGAM21 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DAAM2. The function of DAAM2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM15. Selectin E (endothelial adhesion molecule 1) (SELE, Accession NM_000450) is another VGAM21 host target gene. SELE BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SELE, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SELE BINDING SITE, designated SEQ ID:747, to the nucleotide sequence of VGAM21 RNA, herein designated VGAM RNA, also designated SEQ ID:356.

[0319] Another function of VGAM21 is therefore inhibition of Selectin E (endothelial adhesion molecule 1) (SELE, Accession NM_000450), a gene which expressed on cytokine induced endothelial cells and mediates their binding to leukocytes. Accordingly, utilities of VGAM21 include diagnosis, prevention and treatment of diseases and clinical

conditions associated with SELE. The function of SELE and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM15. KIAA0475 (Accession NM_014864) is another VGAM21 host target gene. KIAA0475 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0475, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0475 BINDING SITE, designated SEQ ID:1570, to the nucleotide sequence of VGAM21 RNA, herein designated VGAM RNA, also designated SEQ ID:356.

[0320] Another function of VGAM21 is therefore inhibition of KIAA0475 (Accession NM_014864). Accordingly, utilities of VGAM21 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0475. LOC222671 (Accession XM_167094) is another VGAM21 host target gene. LOC222671 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC222671, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222671 BINDING SITE, designated SEQ ID:3582, to the nucleotide sequence of VGAM21 RNA, herein designated VGAM RNA, also designated SEQ ID:356.

[0321] Another function of VGAM21 is therefore inhibition of LOC222671 (Accession XM_167094). Accordingly, utilities of VGAM21 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222671. LOC254901 (Accession XM_171878) is another VGAM21 host target gene. LOC254901 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC254901, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254901 BINDING SITE, designated SEQ ID:3699, to the nucleotide sequence of VGAM21 RNA, herein designated VGAM RNA, also designated SEQ ID:356.

[0322] Another function of VGAM21 is therefore inhibition of LOC254901 (Accession XM_171878). Accordingly, utilities of VGAM21 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC254901. LOC257615 (Accession XM_175293) is another VGAM21 host target gene. LOC257615 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC257615, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257615 BINDING SITE, designated SEQ ID:3749, to the nucleotide sequence of VGAM21 RNA, herein designated VGAM RNA, also designated SEQ ID:356.

[0323] Another function of VGAM21 is therefore inhibition of LOC257615 (Accession XM_175293). Accordingly, utilities of VGAM21 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257615. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 22 (VGAM22) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[0324] VGAM22 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The

method by which VGAM22 was detected is described hereinabove with reference to Figs. 1–8.

[0325] VGAM22 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus. VGAM22 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[0326] VGAM22 gene encodes a VGAM22 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM22 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM22 precursor RNA is designated SEQ ID:8, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:8 is located at position 188927 relative to the genome of Vaccinia Virus.

[0327] VGAM22 precursor RNA folds onto itself, forming VGAM22 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate

or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[0328] An enzyme complex designated DICER COMPLEX, `dices` the VGAM22 folded precursor RNA into VGAM22 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of VGAM22 RNA is designated SEQ ID:357, and is provided hereinbelow with reference to the sequence listing part.

[0329] VGAM22 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM22 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM22 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[0330] VGAM22 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites lo-

cated in untranslated regions of VGAM22 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM22 RNA is an accurate or a partial inverted-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM22 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM22 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[0331] The complementary binding of VGAM22 RNA, herein designated VGAM RNA, to host target binding sites on VGAM22 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and

BINDING SITE III, inhibits translation of VGAM22 host target RNA into VGAM22 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[0332] It is appreciated that VGAM22 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM22 host target genes. The mRNA of each one of this plurality of VGAM22 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM22 RNA, herein designated VGAM RNA, and which when bound by VGAM22 RNA causes inhibition of translation of respective one or more VGAM22 host target proteins.

[0333] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM22 gene, herein designated VGAM GENE, on one or more VGAM22 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only

for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[0334] It is yet further appreciated that a function of VGAM22 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM22 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM22 correlate with, and may be deduced from, the identity of the host target genes which VGAM22 binds and inhibits, and the function of these host target genes, as elaborated herein-below.

[0335] Nucleotide sequences of the VGAM22 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM22 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM22 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM22 are further de-

scribed hereinbelow with reference to Table 1.

[0336] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM22 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM22 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[0337] As mentioned hereinabove with reference to Fig. 1, a function of VGAM22 gene, herein designated VGAM is inhibition of expression of VGAM22 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM22 correlate with, and may be deduced from, the identity of the target genes which VGAM22 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[0338] Calpain 2, (m/II) Large Subunit (CAPN2, Accession NM_001748) is a VGAM22 host target gene. CAPN2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CAPN2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

CAPN2 BINDING SITE, designated SEQ ID:855, to the nucleotide sequence of VGAM22 RNA, herein designated VGAM RNA, also designated SEQ ID:357.

[0339] A function of VGAM22 is therefore inhibition of Calpain 2, (m/II) Large Subunit (CAPN2, Accession NM_001748). Accordingly, utilities of VGAM22 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CAPN2. Dishevelled Associated Activator of Morphogenesis 2 (DAAM2, Accession XM_166434) is another VGAM22 host target gene. DAAM2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DAAM2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DAAM2 BINDING SITE, designated SEQ ID:3559, to the nucleotide sequence of VGAM22 RNA, herein designated VGAM RNA, also designated SEQ ID:357.

[0340] Another function of VGAM22 is therefore inhibition of Dishevelled Associated Activator of Morphogenesis 2 (DAAM2, Accession XM_166434), a gene which controls cell polarity and movement during development. Accordingly, utilities of VGAM22 include diagnosis, prevention

and treatment of diseases and clinical conditions associated with DAAM2. The function of DAAM2 and its association with various diseases and clinical conditions, has been established by previous studies, as described herein above with reference to VGAM15. Selectin E (endothelial adhesion molecule 1) (SELE, Accession NM_000450) is another VGAM22 host target gene. SELE BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SELE, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SELE BINDING SITE, designated SEQ ID:747, to the nucleotide sequence of VGAM22 RNA, herein designated VGAM RNA, also designated SEQ ID:357.

[0341] Another function of VGAM22 is therefore inhibition of Selectin E (endothelial adhesion molecule 1) (SELE, Accession NM_000450), a gene which expressed on cytokine induced endothelial cells and mediates their binding to leukocytes. Accordingly, utilities of VGAM22 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SELE. The function of SELE and its association with various diseases and clinical condi-

tions, has been established by previous studies, as described hereinabove with reference to VGAM15.KIAA0475 (Accession NM_014864) is another VGAM22 host target gene. KIAA0475 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0475, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0475 BINDING SITE, designated SEQ ID:1570, to the nucleotide sequence of VGAM22 RNA, herein designated VGAM RNA, also designated SEQ ID:357.

[0342] Another function of VGAM22 is therefore inhibition of KIAA0475 (Accession NM_014864). Accordingly, utilities of VGAM22 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0475. LOC222671 (Accession XM_167094) is another VGAM22 host target gene. LOC222671 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC222671, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

LOC222671 BINDING SITE, designated SEQ ID:3582, to the nucleotide sequence of VGAM22 RNA, herein designated VGAM RNA, also designated SEQ ID:357.

[0343] Another function of VGAM22 is therefore inhibition of LOC222671 (Accession XM_167094). Accordingly, utilities of VGAM22 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222671. LOC254901 (Accession XM_171878) is another VGAM22 host target gene. LOC254901 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC254901, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254901 BINDING SITE, designated SEQ ID:3699, to the nucleotide sequence of VGAM22 RNA, herein designated VGAM RNA, also designated SEQ ID:357.

[0344] Another function of VGAM22 is therefore inhibition of LOC254901 (Accession XM_171878). Accordingly, utilities of VGAM22 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254901. LOC257615 (Accession XM_175293) is another VGAM22 host target gene. LOC257615 BINDING

SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC257615, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257615 BINDING SITE, designated SEQ ID:3749, to the nucleotide sequence of VGAM22 RNA, herein designated VGAM RNA, also designated SEQ ID:357.

[0345] Another function of VGAM22 is therefore inhibition of LOC257615 (Accession XM_175293). Accordingly, utilities of VGAM22 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257615. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 23 (VGAM23) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[0346] VGAM23 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM23 was detected is described hereinabove with reference to Figs. 1-8.

[0347] VGAM23 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus. VGAM23 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[0348] VGAM23 gene encodes a VGAM23 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM23 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM23 precursor RNA is designated SEQ ID:9, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:9 is located at position 188927 relative to the genome of Vaccinia Virus.

[0349] VGAM23 precursor RNA folds onto itself, forming VGAM23 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[0350] An enzyme complex designated DICER COMPLEX, `dices` the VGAM23 folded precursor RNA into VGAM23 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of VGAM23 RNA is designated SEQ ID:358, and is provided hereinbelow with reference to the sequence listing part.

[0351] VGAM23 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM23 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM23 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[0352] VGAM23 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM23 host target RNA, herein designated VGAM HOST TARGET RNA. This com-

plementary binding is due to the fact that the nucleotide sequence of VGAM23 RNA is an accurate or a partial inverted-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM23 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM23 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[0353] The complementary binding of VGAM23 RNA, herein designated VGAM RNA, to host target binding sites on VGAM23 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM23 host target RNA into VGAM23 host target protein, herein desig-

nated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[0354] It is appreciated that VGAM23 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM23 host target genes. The mRNA of each one of this plurality of VGAM23 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM23 RNA, herein designated VGAM RNA, and which when bound by VGAM23 RNA causes inhibition of translation of respective one or more VGAM23 host target proteins.

[0355] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM23 gene, herein designated VGAM GENE, on one or more VGAM23 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also

believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[0356] It is yet further appreciated that a function of VGAM23 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM23 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM23 correlate with, and may be deduced from, the identity of the host target genes which VGAM23 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[0357] Nucleotide sequences of the VGAM23 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM23 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM23 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM23 are further described hereinbelow with reference to Table 1.

[0358] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM23 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM23 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[0359] As mentioned hereinabove with reference to Fig. 1, a function of VGAM23 gene, herein designated VGAM is inhibition of expression of VGAM23 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM23 correlate with, and may be deduced from, the identity of the target genes which VGAM23 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[0360] Calpain 2, (m/II) Large Subunit (CAPN2, Accession NM_001748) is a VGAM23 host target gene. CAPN2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CAPN2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CAPN2 BINDING SITE, designated SEQ ID:855, to the nucleotide sequence of VGAM23 RNA, herein designated

VGAM RNA, also designated SEQ ID:358.

[0361] A function of VGAM23 is therefore inhibition of Calpain 2, (m/II) Large Subunit (CAPN2, Accession NM_001748). Accordingly, utilities of VGAM23 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CAPN2. Dishevelled Associated Activator of Morphogenesis 2 (DAAM2, Accession XM_166434) is another VGAM23 host target gene. DAAM2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DAAM2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DAAM2 BINDING SITE, designated SEQ ID:3559, to the nucleotide sequence of VGAM23 RNA, herein designated VGAM RNA, also designated SEQ ID:358.

[0362] Another function of VGAM23 is therefore inhibition of Dishevelled Associated Activator of Morphogenesis 2 (DAAM2, Accession XM_166434), a gene which controls cell polarity and movement during development. Accordingly, utilities of VGAM23 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DAAM2. The function of DAAM2 and its associa-

tion with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM15. Selectin E (endothelial adhesion molecule 1) (SELE, Accession NM_000450) is another VGAM23 host target gene. SELE BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SELE, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SELE BINDING SITE, designated SEQ ID:747, to the nucleotide sequence of VGAM23 RNA, herein designated VGAM RNA, also designated SEQ ID:358.

[0363] Another function of VGAM23 is therefore inhibition of Selectin E (endothelial adhesion molecule 1) (SELE, Accession NM_000450), a gene which expressed on cytokine induced endothelial cells and mediates their binding to leukocytes. Accordingly, utilities of VGAM23 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SELE. The function of SELE and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM15. KIAA0475

(Accession NM_014864) is another VGAM23 host target gene. KIAA0475 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0475, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0475 BINDING SITE, designated SEQ ID:1570, to the nucleotide sequence of VGAM23 RNA, herein designated VGAM RNA, also designated SEQ ID:358.

[0364] Another function of VGAM23 is therefore inhibition of KIAA0475 (Accession NM_014864). Accordingly, utilities of VGAM23 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0475. LOC222671 (Accession XM_167094) is another VGAM23 host target gene. LOC222671 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC222671, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222671 BINDING SITE, designated SEQ ID:3582, to the nucleotide sequence of VGAM23 RNA, herein designated

VGAM RNA, also designated SEQ ID:358.

[0365] Another function of VGAM23 is therefore inhibition of LOC222671 (Accession XM_167094). Accordingly, utilities of VGAM23 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222671. LOC254901 (Accession XM_171878) is another VGAM23 host target gene. LOC254901 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC254901, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254901 BINDING SITE, designated SEQ ID:3699, to the nucleotide sequence of VGAM23 RNA, herein designated VGAM RNA, also designated SEQ ID:358.

[0366] Another function of VGAM23 is therefore inhibition of LOC254901 (Accession XM_171878). Accordingly, utilities of VGAM23 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254901. LOC257615 (Accession XM_175293) is another VGAM23 host target gene. LOC257615 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC257615, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257615 BINDING SITE, designated SEQ ID:3749, to the nucleotide sequence of VGAM23 RNA, herein designated VGAM RNA, also designated SEQ ID:358.

[0367] Another function of VGAM23 is therefore inhibition of LOC257615 (Accession XM_175293). Accordingly, utilities of VGAM23 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257615. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 24 (VGAM24) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[0368] VGAM24 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM24 was detected is described hereinabove with reference to Figs. 1–8.

[0369] VGAM24 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus. VGAM24

host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[0370] VGAM24 gene encodes a VGAM24 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM24 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM24 precursor RNA is designated SEQ ID:10, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:10 is located at position 188927 relative to the genome of Vaccinia Virus.

[0371] VGAM24 precursor RNA folds onto itself, forming VGAM24 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[0372] An enzyme complex designated DICER COMPLEX, `dices` the VGAM24 folded precursor RNA into VGAM24 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of VGAM24 RNA is designated SEQ ID:359, and is provided hereinbelow with reference to the sequence listing part.

[0373] VGAM24 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM24 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM24 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[0374] VGAM24 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM24 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM24 RNA is an accurate or a partial in-

versed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM24 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM24 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[0375] The complementary binding of VGAM24 RNA, herein designated VGAM RNA, to host target binding sites on VGAM24 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM24 host target RNA into VGAM24 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[0376] It is appreciated that VGAM24 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM24 host target genes. The mRNA of each one of this plurality of VGAM24 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM24 RNA, herein designated VGAM RNA, and which when bound by VGAM24 RNA causes inhibition of translation of respective one or more VGAM24 host target proteins.

[0377] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM24 gene, herein designated VGAM GENE, on one or more VGAM24 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although spe-

cific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[0378] It is yet further appreciated that a function of VGAM24 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM24 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM24 correlate with, and may be deduced from, the identity of the host target genes which VGAM24 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[0379] Nucleotide sequences of the VGAM24 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM24 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM24 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM24 are further described hereinbelow with reference to Table 1.

[0380] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM24 host target RNA, and schematic

representation of the complementarity of each of these host target binding sites to VGAM24 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[0381] As mentioned hereinabove with reference to Fig. 1, a function of VGAM24 gene, herein designated VGAM is inhibition of expression of VGAM24 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM24 correlate with, and may be deduced from, the identity of the target genes which VGAM24 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[0382] Calpain 2, (m/II) Large Subunit (CAPN2, Accession NM_001748) is a VGAM24 host target gene. CAPN2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CAPN2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CAPN2 BINDING SITE, designated SEQ ID:855, to the nucleotide sequence of VGAM24 RNA, herein designated VGAM RNA, also designated SEQ ID:359.

[0383] A function of VGAM24 is therefore inhibition of Calpain 2,

(m/II) Large Subunit (CAPN2, Accession NM_001748). Accordingly, utilities of VGAM24 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CAPN2. Dishevelled Associated Activator of Morphogenesis 2 (DAAM2, Accession XM_166434) is another VGAM24 host target gene. DAAM2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DAAM2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DAAM2 BINDING SITE, designated SEQ ID:3559, to the nucleotide sequence of VGAM24 RNA, herein designated VGAM RNA, also designated SEQ ID:359.

[0384] Another function of VGAM24 is therefore inhibition of Dishevelled Associated Activator of Morphogenesis 2 (DAAM2, Accession XM_166434), a gene which controls cell polarity and movement during development. Accordingly, utilities of VGAM24 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DAAM2. The function of DAAM2 and its association with various diseases and clinical conditions, has been established by previous studies, as described here-

inabove with reference to VGAM15. Selectin E (endothelial adhesion molecule 1) (SELE, Accession NM_000450) is another VGAM24 host target gene. SELE BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SELE, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SELE BINDING SITE, designated SEQ ID:747, to the nucleotide sequence of VGAM24 RNA, herein designated VGAM RNA, also designated SEQ ID:359.

[0385] Another function of VGAM24 is therefore inhibition of Selectin E (endothelial adhesion molecule 1) (SELE, Accession NM_000450), a gene which expressed on cytokine induced endothelial cells and mediates their binding to leukocytes. Accordingly, utilities of VGAM24 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SELE. The function of SELE and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM15. KIAA0475 (Accession NM_014864) is another VGAM24 host target gene. KIAA0475 BINDING SITE is HOST TARGET binding

site found in the 3' untranslated region of mRNA encoded by KIAA0475, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0475 BINDING SITE, designated SEQ ID:1570, to the nucleotide sequence of VGAM24 RNA, herein designated VGAM RNA, also designated SEQ ID:359.

[0386] Another function of VGAM24 is therefore inhibition of KIAA0475 (Accession NM_014864). Accordingly, utilities of VGAM24 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0475. LOC222671 (Accession XM_167094) is another VGAM24 host target gene. LOC222671 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC222671, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222671 BINDING SITE, designated SEQ ID:3582, to the nucleotide sequence of VGAM24 RNA, herein designated VGAM RNA, also designated SEQ ID:359.

[0387] Another function of VGAM24 is therefore inhibition of

LOC222671 (Accession XM_167094). Accordingly, utilities of VGAM24 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222671. LOC254901 (Accession XM_171878) is another VGAM24 host target gene. LOC254901 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC254901, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254901 BINDING SITE, designated SEQ ID:3699, to the nucleotide sequence of VGAM24 RNA, herein designated VGAM RNA, also designated SEQ ID:359.

[0388] Another function of VGAM24 is therefore inhibition of LOC254901 (Accession XM_171878). Accordingly, utilities of VGAM24 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254901. LOC257615 (Accession XM_175293) is another VGAM24 host target gene. LOC257615 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC257615, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC257615 BINDING SITE, designated SEQ ID:3749, to the nucleotide sequence of VGAM24 RNA, herein designated VGAM RNA, also designated SEQ ID:359.

[0389] Another function of VGAM24 is therefore inhibition of LOC257615 (Accession XM_175293). Accordingly, utilities of VGAM24 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257615. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 25 (VGAM25) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[0390] VGAM25 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM25 was detected is described hereinabove with reference to Figs. 1–8.

[0391] VGAM25 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus. VGAM25 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[0392] VGAM25 gene encodes a VGAM25 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM25 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM25 precursor RNA is designated SEQ ID:11, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:11 is located at position 188927 relative to the genome of Vaccinia Virus.

[0393] VGAM25 precursor RNA folds onto itself, forming VGAM25 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[0394] An enzyme complex designated DICER COMPLEX, `dices` the VGAM25 folded precursor RNA into VGAM25 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of VGAM25 RNA is designated SEQ ID:360, and is provided hereinbelow with reference to the sequence listing part.

[0395] VGAM25 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM25 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM25 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[0396] VGAM25 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM25 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM25 RNA is an accurate or a partial inverted-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration,

Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM25 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM25 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR and 5' UTR regions.

[0397] The complementary binding of VGAM25 RNA, herein designated VGAM RNA, to host target binding sites on VGAM25 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM25 host target RNA into VGAM25 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[0398] It is appreciated that VGAM25 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM25 host target genes. The mRNA of each one of this plurality of VGAM25 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM25 RNA, herein designated VGAM RNA, and which when bound by VGAM25 RNA causes inhibition of translation of respective one or more VGAM25 host target proteins.

[0399] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM25 gene, herein designated VGAM GENE, on one or more VGAM25 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective:

Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[0400] It is yet further appreciated that a function of VGAM25 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM25 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM25 correlate with, and may be deduced from, the identity of the host target genes which VGAM25 binds and inhibits, and the function of these host target genes, as elaborated herein-below.

[0401] Nucleotide sequences of the VGAM25 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM25 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM25 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM25 are further described hereinbelow with reference to Table 1.

[0402] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM25 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM25 RNA, herein desig-

nated VGAM RNA, are described hereinbelow with reference to Table 2.

[0403] As mentioned hereinabove with reference to Fig. 1, a function of VGAM25 gene, herein designated VGAM is inhibition of expression of VGAM25 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM25 correlate with, and may be deduced from, the identity of the target genes which VGAM25 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[0404] Calpain 2, (m/II) Large Subunit (CAPN2, Accession NM_001748) is a VGAM25 host target gene. CAPN2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CAPN2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CAPN2 BINDING SITE, designated SEQ ID:855, to the nucleotide sequence of VGAM25 RNA, herein designated VGAM RNA, also designated SEQ ID:360.

[0405] A function of VGAM25 is therefore inhibition of Calpain 2, (m/II) Large Subunit (CAPN2, Accession NM_001748). Accordingly, utilities of VGAM25 include diagnosis, preven-

tion and treatment of diseases and clinical conditions associated with CAPN2. Dishevelled Associated Activator of Morphogenesis 2 (DAAM2, Accession XM_166434) is another VGAM25 host target gene. DAAM2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DAAM2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DAAM2 BINDING SITE, designated SEQ ID:3559, to the nucleotide sequence of VGAM25 RNA, herein designated VGAM RNA, also designated SEQ ID:360.

[0406] Another function of VGAM25 is therefore inhibition of Dishevelled Associated Activator of Morphogenesis 2 (DAAM2, Accession XM_166434), a gene which controls cell polarity and movement during development. Accordingly, utilities of VGAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DAAM2. The function of DAAM2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM15. Selectin E (endothelial adhesion molecule 1) (SELE, Accession NM_000450) is an-

other VGAM25 host target gene. SELE BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SELE, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SELE BINDING SITE, designated SEQ ID:747, to the nucleotide sequence of VGAM25 RNA, herein designated VGAM RNA, also designated SEQ ID:360.

[0407] Another function of VGAM25 is therefore inhibition of Selectin E (endothelial adhesion molecule 1) (SELE, Accession NM_000450), a gene which expressed on cytokine induced endothelial cells and mediates their binding to leukocytes. Accordingly, utilities of VGAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SELE. The function of SELE and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM15. KIAA0475 (Accession NM_014864) is another VGAM25 host target gene. KIAA0475 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0475, corresponding to a HOST TARGET binding

site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0475 BINDING SITE, designated SEQ ID:1570, to the nucleotide sequence of VGAM25 RNA, herein designated VGAM RNA, also designated SEQ ID:360.

[0408] Another function of VGAM25 is therefore inhibition of KIAA0475 (Accession NM_014864). Accordingly, utilities of VGAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0475. LOC222671 (Accession XM_167094) is another VGAM25 host target gene. LOC222671 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC222671, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222671 BINDING SITE, designated SEQ ID:3582, to the nucleotide sequence of VGAM25 RNA, herein designated VGAM RNA, also designated SEQ ID:360.

[0409] Another function of VGAM25 is therefore inhibition of LOC222671 (Accession XM_167094). Accordingly, utilities of VGAM25 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LOC222671. LOC254901 (Accession XM_171878) is another VGAM25 host target gene. LOC254901 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC254901, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254901 BINDING SITE, designated SEQ ID:3699, to the nucleotide sequence of VGAM25 RNA, herein designated VGAM RNA, also designated SEQ ID:360.

[0410] Another function of VGAM25 is therefore inhibition of LOC254901 (Accession XM_171878). Accordingly, utilities of VGAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254901. LOC257615 (Accession XM_175293) is another VGAM25 host target gene. LOC257615 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC257615, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257615 BINDING SITE, designated SEQ ID:3749, to

the nucleotide sequence of VGAM25 RNA, herein designated VGAM RNA, also designated SEQ ID:360.

[0411] Another function of VGAM25 is therefore inhibition of LOC257615 (Accession XM_175293). Accordingly, utilities of VGAM25 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257615. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 26 (VGAM26) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[0412] VGAM26 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM26 was detected is described hereinabove with reference to Figs. 1–8.

[0413] VGAM26 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus. VGAM26 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[0414] VGAM26 gene encodes a VGAM26 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, VGAM26 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM26 precursor RNA is designated SEQ ID:12, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:12 is located at position 189067 relative to the genome of Vaccinia Virus.

[0415] VGAM26 precursor RNA folds onto itself, forming VGAM26 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[0416] An enzyme complex designated DICER COMPLEX, `dices` the VGAM26 folded precursor RNA into VGAM26 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 78%) nucleotide sequence of VGAM26 RNA is designated SEQ ID:361, and is provided hereinbelow with reference to the sequence listing part.

[0417] VGAM26 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM26 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM26 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[0418] VGAM26 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM26 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM26 RNA is an accurate or a partial inverted-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III

respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM26 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM26 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR and 5' UTR regions.

[0419] The complementary binding of VGAM26 RNA, herein designated VGAM RNA, to host target binding sites on VGAM26 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM26 host target RNA into VGAM26 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[0420] It is appreciated that VGAM26 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM26 host target genes. The mRNA of each one of this plurality of VGAM26 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM26 RNA, herein designated VGAM RNA, and which when bound by VGAM26 RNA causes inhibition of translation of respective one or more VGAM26 host target proteins.

[0421] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM26 gene, herein designated VGAM GENE, on one or more VGAM26 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[0422] It is yet further appreciated that a function of VGAM26 is

inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM26 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM26 correlate with, and may be deduced from, the identity of the host target genes which VGAM26 binds and inhibits, and the function of these host target genes, as elaborated herein—below.

[0423] Nucleotide sequences of the VGAM26 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM26 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM26 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM26 are further described hereinbelow with reference to Table 1.

[0424] Nucleotide sequences of host target binding sites, such as BINDING SITE–I, BINDING SITE–II and BINDING SITE–III of Fig. 1, found on VGAM26 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM26 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[0425] As mentioned hereinabove with reference to Fig. 1, a function of VGAM26 gene, herein designated VGAM is inhibition of expression of VGAM26 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM26 correlate with, and may be deduced from, the identity of the target genes which VGAM26 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[0426] Integrin, Beta 7 (ITGB7, Accession NM_000889) is a VGAM26 host target gene. ITGB7 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by ITGB7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ITGB7 BINDING SITE, designated SEQ ID:783, to the nucleotide sequence of VGAM26 RNA, herein designated VGAM RNA, also designated SEQ ID:361.

[0427] A function of VGAM26 is therefore inhibition of Integrin, Beta 7 (ITGB7, Accession NM_000889), a gene which may play a role in adhesive interactions of leukocytes. Accordingly, utilities of VGAM26 include diagnosis, prevention and treatment of diseases and clinical conditions associ-

ated with ITGB7. The function of ITGB7 has been established by previous studies. The integrins are a large family of heterodimeric cell-surface glycoproteins that play key roles in the adherence of cells to other cells and to extracellular matrix proteins. Leukocytes express a variety of integrins that are crucial participants in the inflammatory and immune responses. All integrins are composed of 1 alpha subunit and 1 beta subunit that are translated separately and are noncovalently associated. The cDNA sequences of 6 mammalian beta subunits, numbered beta-1 through beta-6, had previously been reported. Erle et al. (1991) determined the complete sequence of a novel integrin beta subunit from leukocytes, designated beta-7. The cDNA contained a single large open reading frame predicted to encode a 798-amino acid protein precursor (signal peptide plus mature protein). Like other beta-subunit proteins, it was predicted to contain a large extracellular domain, a transmembrane domain, and a cytoplasmic tail. The deduced beta-7 amino acid sequence was 32 to 46% identical to the 6 previously sequenced subunits. It was most similar to the leukocyte integrin common beta subunit (ITGB2; CD18; 116920). Erle et al. (1991) predicted that integrin beta-7 plays a role in adhe-

sive interactions of leukocytes. Krissansen et al. (1992) assigned the ITGB7 gene to human chromosome 12 by analysis of somatic cell hybrids. Krissansen et al. (1992) commented on the fact that the gene encoding the alpha subunit of the fibronectin receptor (FNRA; 135620) resides on chromosome 12 also. They stated that the 'extent and evolutionary significance of linkages between integrin genes..remains to be determined.' Baker et al. (1992) assigned the ITGB7 gene to 12q13.13 by nonisotopic in situ hybridization. Yuan et al. (1992) mapped the mouse homolog Itgb-7 to chromosome 15 by study of mouse-hamster somatic cell hybrids and by interspecific backcrosses.

[0428] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[0429] Baker, E.; Sutherland, G. R.; Jiang, W.-M.; Yuan, Q.; Leung, E.; Watson, J. D.; Krissansen, G. W. : Mapping of the human integrin beta-7 gene (ITG-beta-7) to 12q13.13 by non-isotopic in situ hybridization. Mammalian Genome 2: 272-273, 1992. ; and

[0430] Erle, D. J.; Ruegg, C.; Sheppard, D.; Pytela, R. : Complete amino acid sequence of an integrin beta subunit (beta-7)

identified in leukocytes. J. Biol. Chem. 266: 11009–11016, 1991.

[0431] Further studies establishing the function and utilities of ITGB7 are found in John Hopkins OMIM database record ID 147559, and in cited publications numbered 3017–3018, 301 and 3019 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. RPP30 (Accession NM_006413) is another VGAM26 host target gene. RPP30 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RPP30, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RPP30 BINDING SITE, designated SEQ ID:1297, to the nucleotide sequence of VGAM26 RNA, herein designated VGAM RNA, also designated SEQ ID:361.

[0432] Another function of VGAM26 is therefore inhibition of RPP30 (Accession NM_006413), a gene which is a component of ribonuclease p that processes 5' ends of precursor tRNAs. Accordingly, utilities of VGAM26 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RPP30. The function of RPP30 has

been established by previous studies. By biochemical purification of RNase P, micropeptide sequence analysis, and EST database searching, Eder et al. (1997) obtained a cDNA encoding RPP30. The deduced protein contains 268 amino acids with a predicted molecular mass of nearly 30 kD. Jarrous et al. (1998) determined that RPP30 is a target for antisera from systemic sclerosis patients. Immunoprecipitation analysis showed that polyclonal antibodies raised against RPP20, RPP30, RPP38, or RPP40 interact with RNase P from HeLa cells.

[0433] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[0434] Eder, P. S.; Kekuda, R.; Stolc, V.; Altman, S. : Characterization of two scleroderma autoimmune antigens that copurify with human ribonuclease P. *Proc. Nat. Acad. Sci.* 94: 1101–1106, 1997. ; and

[0436] Further studies establishing the function and utilities of RPP30 are found in John Hopkins OMIM database record

ID 606115, and in cited publications numbered 18 and 209 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. FLJ13263 (Accession NM_025125) is another VGAM26 host target gene. FLJ13263 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ13263, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13263 BINDING SITE, designated SEQ ID:2139, to the nucleotide sequence of VGAM26 RNA, herein designated VGAM RNA, also designated SEQ ID:361.

[0437] Another function of VGAM26 is therefore inhibition of FLJ13263 (Accession NM_025125). Accordingly, utilities of VGAM26 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13263. FLJ23074 (Accession NM_025052) is another VGAM26 host target gene. FLJ23074 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ23074, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of FLJ23074 BINDING SITE, designated SEQ ID:2133, to the nucleotide sequence of VGAM26 RNA, herein designated VGAM RNA, also designated SEQ ID:361.

[0438] Another function of VGAM26 is therefore inhibition of FLJ23074 (Accession NM_025052). Accordingly, utilities of VGAM26 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23074. General Transcription Factor IIA, 2, 12kDa (GTF2A2, Accession NM_004492) is another VGAM26 host target gene. GTF2A2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GTF2A2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GTF2A2 BINDING SITE, designated SEQ ID:1119, to the nucleotide sequence of VGAM26 RNA, herein designated VGAM RNA, also designated SEQ ID:361.

[0439] Another function of VGAM26 is therefore inhibition of General Transcription Factor IIA, 2, 12kDa (GTF2A2, Accession NM_004492). Accordingly, utilities of VGAM26 include diagnosis, prevention and treatment of diseases and

clinical conditions associated with GTF2A2. IMP-2 (Accession NM_006548) is another VGAM26 host target gene. IMP-2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by IMP-2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IMP-2 BINDING SITE, designated SEQ ID:1308, to the nucleotide sequence of VGAM26 RNA, herein designated VGAM RNA, also designated SEQ ID:361.

[0440] Another function of VGAM26 is therefore inhibition of IMP-2 (Accession NM_006548). Accordingly, utilities of VGAM26 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IMP-2. KIAA0212 (Accession NM_014674) is another VGAM26 host target gene. KIAA0212 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0212, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0212 BINDING SITE, designated SEQ ID:1518, to the nucleotide sequence of

VGAM26 RNA, herein designated VGAM RNA, also designated SEQ ID:361.

[0441] Another function of VGAM26 is therefore inhibition of KIAA0212 (Accession NM_014674). Accordingly, utilities of VGAM26 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0212. Oxysterol Binding Protein-like 2 (OSBPL2, Accession NM_014835) is another VGAM26 host target gene. OSBPL2 BINDING SITE1 and OSBPL2 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by OSBPL2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OSBPL2 BINDING SITE1 and OSBPL2 BINDING SITE2, designated SEQ ID:1566 and SEQ ID:2482 respectively, to the nucleotide sequence of VGAM26 RNA, herein designated VGAM RNA, also designated SEQ ID:361.

[0442] Another function of VGAM26 is therefore inhibition of Oxysterol Binding Protein-like 2 (OSBPL2, Accession NM_014835). Accordingly, utilities of VGAM26 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OSBPL2. LOC254826

(Accession XM_173188) is another VGAM26 host target gene. LOC254826 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC254826, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254826 BINDING SITE, designated SEQ ID:3732, to the nucleotide sequence of VGAM26 RNA, herein designated VGAM RNA, also designated SEQ ID:361.

[0443] Another function of VGAM26 is therefore inhibition of LOC254826 (Accession XM_173188). Accordingly, utilities of VGAM26 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254826. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 27 (VGAM27) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[0444] VGAM27 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The

method by which VGAM27 was detected is described hereinabove with reference to Figs. 1–8.

[0445] VGAM27 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus. VGAM27 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[0446] VGAM27 gene encodes a VGAM27 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM27 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM27 precursor RNA is designated SEQ ID:13, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:13 is located at position 190758 relative to the genome of Vaccinia Virus.

[0447] VGAM27 precursor RNA folds onto itself, forming VGAM27 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate

or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[0448] An enzyme complex designated DICER COMPLEX, `dices` the VGAM27 folded precursor RNA into VGAM27 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 75%) nucleotide sequence of VGAM27 RNA is designated SEQ ID:362, and is provided hereinbelow with reference to the sequence listing part.

[0449] VGAM27 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM27 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM27 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[0450] VGAM27 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites lo-

cated in untranslated regions of VGAM27 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM27 RNA is an accurate or a partial inverted-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM27 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM27 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR and 5' UTR regions.

[0451] The complementary binding of VGAM27 RNA, herein designated VGAM RNA, to host target binding sites on VGAM27 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and

BINDING SITE III, inhibits translation of VGAM27 host target RNA into VGAM27 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[0452] It is appreciated that VGAM27 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM27 host target genes. The mRNA of each one of this plurality of VGAM27 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM27 RNA, herein designated VGAM RNA, and which when bound by VGAM27 RNA causes inhibition of translation of respective one or more VGAM27 host target proteins.

[0453] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM27 gene, herein designated VGAM GENE, on one or more VGAM27 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only

for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[0454] It is yet further appreciated that a function of VGAM27 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM27 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM27 correlate with, and may be deduced from, the identity of the host target genes which VGAM27 binds and inhibits, and the function of these host target genes, as elaborated herein-below.

[0455] Nucleotide sequences of the VGAM27 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM27 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM27 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM27 are further de-

scribed hereinbelow with reference to Table 1.

[0456] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM27 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM27 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[0457] As mentioned hereinabove with reference to Fig. 1, a function of VGAM27 gene, herein designated VGAM is inhibition of expression of VGAM27 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM27 correlate with, and may be deduced from, the identity of the target genes which VGAM27 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[0458] Calpain 2, (m/II) Large Subunit (CAPN2, Accession NM_001748) is a VGAM27 host target gene. CAPN2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CAPN2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

CAPN2 BINDING SITE, designated SEQ ID:855, to the nucleotide sequence of VGAM27 RNA, herein designated VGAM RNA, also designated SEQ ID:362.

[0459] A function of VGAM27 is therefore inhibition of Calpain 2, (m/II) Large Subunit (CAPN2, Accession NM_001748). Accordingly, utilities of VGAM27 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CAPN2. Dishevelled Associated Activator of Morphogenesis 2 (DAAM2, Accession XM_166434) is another VGAM27 host target gene. DAAM2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DAAM2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DAAM2 BINDING SITE, designated SEQ ID:3559, to the nucleotide sequence of VGAM27 RNA, herein designated VGAM RNA, also designated SEQ ID:362.

[0460] Another function of VGAM27 is therefore inhibition of Dishevelled Associated Activator of Morphogenesis 2 (DAAM2, Accession XM_166434), a gene which controls cell polarity and movement during development. Accordingly, utilities of VGAM27 include diagnosis, prevention

and treatment of diseases and clinical conditions associated with DAAM2. The function of DAAM2 and its association with various diseases and clinical conditions, has been established by previous studies, as described herein above with reference to VGAM15. Selectin E (endothelial adhesion molecule 1) (SELE, Accession NM_000450) is another VGAM27 host target gene. SELE BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SELE, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SELE BINDING SITE, designated SEQ ID:747, to the nucleotide sequence of VGAM27 RNA, herein designated VGAM RNA, also designated SEQ ID:362.

[0461] Another function of VGAM27 is therefore inhibition of Selectin E (endothelial adhesion molecule 1) (SELE, Accession NM_000450), a gene which expressed on cytokine induced endothelial cells and mediates their binding to leukocytes. Accordingly, utilities of VGAM27 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SELE. The function of SELE and its association with various diseases and clinical condi-

tions, has been established by previous studies, as described hereinabove with reference to VGAM15.KIAA0475 (Accession NM_014864) is another VGAM27 host target gene. KIAA0475 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0475, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0475 BINDING SITE, designated SEQ ID:1570, to the nucleotide sequence of VGAM27 RNA, herein designated VGAM RNA, also designated SEQ ID:362.

[0462] Another function of VGAM27 is therefore inhibition of KIAA0475 (Accession NM_014864). Accordingly, utilities of VGAM27 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0475. LOC222671 (Accession XM_167094) is another VGAM27 host target gene. LOC222671 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC222671, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

LOC222671 BINDING SITE, designated SEQ ID:3582, to the nucleotide sequence of VGAM27 RNA, herein designated VGAM RNA, also designated SEQ ID:362.

[0463] Another function of VGAM27 is therefore inhibition of LOC222671 (Accession XM_167094). Accordingly, utilities of VGAM27 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222671. LOC254901 (Accession XM_171878) is another VGAM27 host target gene. LOC254901 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC254901, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254901 BINDING SITE, designated SEQ ID:3699, to the nucleotide sequence of VGAM27 RNA, herein designated VGAM RNA, also designated SEQ ID:362.

[0464] Another function of VGAM27 is therefore inhibition of LOC254901 (Accession XM_171878). Accordingly, utilities of VGAM27 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254901. LOC257615 (Accession XM_175293) is another VGAM27 host target gene. LOC257615 BINDING

SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC257615, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257615 BINDING SITE, designated SEQ ID:3749, to the nucleotide sequence of VGAM27 RNA, herein designated VGAM RNA, also designated SEQ ID:362.

[0465] Another function of VGAM27 is therefore inhibition of LOC257615 (Accession XM_175293). Accordingly, utilities of VGAM27 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257615. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 28 (VGAM28) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[0466] VGAM28 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM28 was detected is described hereinabove with reference to Figs. 1-8.

[0467] VGAM28 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus. VGAM28 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[0468] VGAM28 gene encodes a VGAM28 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM28 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM28 precursor RNA is designated SEQ ID:14, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:14 is located at position 190758 relative to the genome of Vaccinia Virus.

[0469] VGAM28 precursor RNA folds onto itself, forming VGAM28 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[0470] An enzyme complex designated DICER COMPLEX, `dices` the VGAM28 folded precursor RNA into VGAM28 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 75%) nucleotide sequence of VGAM28 RNA is designated SEQ ID:363, and is provided hereinbelow with reference to the sequence listing part.

[0471] VGAM28 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM28 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM28 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[0472] VGAM28 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM28 host target RNA, herein designated VGAM HOST TARGET RNA. This com-

plementary binding is due to the fact that the nucleotide sequence of VGAM28 RNA is an accurate or a partial inverted-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM28 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM28 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[0473] The complementary binding of VGAM28 RNA, herein designated VGAM RNA, to host target binding sites on VGAM28 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM28 host target RNA into VGAM28 host target protein, herein desig-

nated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[0474] It is appreciated that VGAM28 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM28 host target genes. The mRNA of each one of this plurality of VGAM28 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM28 RNA, herein designated VGAM RNA, and which when bound by VGAM28 RNA causes inhibition of translation of respective one or more VGAM28 host target proteins.

[0475] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM28 gene, herein designated VGAM GENE, on one or more VGAM28 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also

believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[0476] It is yet further appreciated that a function of VGAM28 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM28 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM28 correlate with, and may be deduced from, the identity of the host target genes which VGAM28 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[0477] Nucleotide sequences of the VGAM28 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM28 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM28 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM28 are further described hereinbelow with reference to Table 1.

[0478] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM28 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM28 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[0479] As mentioned hereinabove with reference to Fig. 1, a function of VGAM28 gene, herein designated VGAM is inhibition of expression of VGAM28 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM28 correlate with, and may be deduced from, the identity of the target genes which VGAM28 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[0480] Calpain 2, (m/II) Large Subunit (CAPN2, Accession NM_001748) is a VGAM28 host target gene. CAPN2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CAPN2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CAPN2 BINDING SITE, designated SEQ ID:855, to the nucleotide sequence of VGAM28 RNA, herein designated

VGAM RNA, also designated SEQ ID:363.

[0481] A function of VGAM28 is therefore inhibition of Calpain 2, (m/II) Large Subunit (CAPN2, Accession NM_001748). Accordingly, utilities of VGAM28 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CAPN2. Dishevelled Associated Activator of Morphogenesis 2 (DAAM2, Accession XM_166434) is another VGAM28 host target gene. DAAM2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DAAM2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DAAM2 BINDING SITE, designated SEQ ID:3559, to the nucleotide sequence of VGAM28 RNA, herein designated VGAM RNA, also designated SEQ ID:363.

[0482] Another function of VGAM28 is therefore inhibition of Dishevelled Associated Activator of Morphogenesis 2 (DAAM2, Accession XM_166434), a gene which controls cell polarity and movement during development. Accordingly, utilities of VGAM28 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DAAM2. The function of DAAM2 and its associa-

tion with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM15. Selectin E (endothelial adhesion molecule 1) (SELE, Accession NM_000450) is another VGAM28 host target gene. SELE BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SELE, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SELE BINDING SITE, designated SEQ ID:747, to the nucleotide sequence of VGAM28 RNA, herein designated VGAM RNA, also designated SEQ ID:363.

[0483] Another function of VGAM28 is therefore inhibition of Selectin E (endothelial adhesion molecule 1) (SELE, Accession NM_000450), a gene which expressed on cytokine induced endothelial cells and mediates their binding to leukocytes. Accordingly, utilities of VGAM28 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SELE. The function of SELE and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM15. KIAA0475

(Accession NM_014864) is another VGAM28 host target gene. KIAA0475 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0475, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0475 BINDING SITE, designated SEQ ID:1570, to the nucleotide sequence of VGAM28 RNA, herein designated VGAM RNA, also designated SEQ ID:363.

[0484] Another function of VGAM28 is therefore inhibition of KIAA0475 (Accession NM_014864). Accordingly, utilities of VGAM28 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0475. LOC222671 (Accession XM_167094) is another VGAM28 host target gene. LOC222671 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC222671, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222671 BINDING SITE, designated SEQ ID:3582, to the nucleotide sequence of VGAM28 RNA, herein designated

VGAM RNA, also designated SEQ ID:363.

[0485] Another function of VGAM28 is therefore inhibition of LOC222671 (Accession XM_167094). Accordingly, utilities of VGAM28 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222671. LOC254901 (Accession XM_171878) is another VGAM28 host target gene. LOC254901 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC254901, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254901 BINDING SITE, designated SEQ ID:3699, to the nucleotide sequence of VGAM28 RNA, herein designated VGAM RNA, also designated SEQ ID:363.

[0486] Another function of VGAM28 is therefore inhibition of LOC254901 (Accession XM_171878). Accordingly, utilities of VGAM28 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254901. LOC257615 (Accession XM_175293) is another VGAM28 host target gene. LOC257615 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC257615, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257615 BINDING SITE, designated SEQ ID:3749, to the nucleotide sequence of VGAM28 RNA, herein designated VGAM RNA, also designated SEQ ID:363.

[0487] Another function of VGAM28 is therefore inhibition of LOC257615 (Accession XM_175293). Accordingly, utilities of VGAM28 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257615. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 29 (VGAM29) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[0488] VGAM29 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM29 was detected is described hereinabove with reference to Figs. 1–8.

[0489] VGAM29 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus. VGAM29

host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[0490] VGAM29 gene encodes a VGAM29 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM29 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM29 precursor RNA is designated SEQ ID:15, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:15 is located at position 188937 relative to the genome of Vaccinia Virus.

[0491] VGAM29 precursor RNA folds onto itself, forming VGAM29 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[0492] An enzyme complex designated DICER COMPLEX, `dices` the VGAM29 folded precursor RNA into VGAM29 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of VGAM29 RNA is designated SEQ ID:364, and is provided hereinbelow with reference to the sequence listing part.

[0493] VGAM29 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM29 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM29 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[0494] VGAM29 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM29 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM29 RNA is an accurate or a partial in-

versed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM29 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM29 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[0495] The complementary binding of VGAM29 RNA, herein designated VGAM RNA, to host target binding sites on VGAM29 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM29 host target RNA into VGAM29 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[0496] It is appreciated that VGAM29 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM29 host target genes. The mRNA of each one of this plurality of VGAM29 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM29 RNA, herein designated VGAM RNA, and which when bound by VGAM29 RNA causes inhibition of translation of respective one or more VGAM29 host target proteins.

[0497] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM29 gene, herein designated VGAM GENE, on one or more VGAM29 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although spe-

cific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[0498] It is yet further appreciated that a function of VGAM29 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM29 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM29 correlate with, and may be deduced from, the identity of the host target genes which VGAM29 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[0499] Nucleotide sequences of the VGAM29 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM29 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM29 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM29 are further described hereinbelow with reference to Table 1.

[0500] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM29 host target RNA, and schematic

representation of the complementarity of each of these host target binding sites to VGAM29 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[0501] As mentioned hereinabove with reference to Fig. 1, a function of VGAM29 gene, herein designated VGAM is inhibition of expression of VGAM29 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM29 correlate with, and may be deduced from, the identity of the target genes which VGAM29 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[0502] Calpain 2, (m/II) Large Subunit (CAPN2, Accession NM_001748) is a VGAM29 host target gene. CAPN2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CAPN2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CAPN2 BINDING SITE, designated SEQ ID:855, to the nucleotide sequence of VGAM29 RNA, herein designated VGAM RNA, also designated SEQ ID:364.

[0503] A function of VGAM29 is therefore inhibition of Calpain 2,

(m/II) Large Subunit (CAPN2, Accession NM_001748). Accordingly, utilities of VGAM29 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CAPN2. Dishevelled Associated Activator of Morphogenesis 2 (DAAM2, Accession XM_166434) is another VGAM29 host target gene. DAAM2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DAAM2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DAAM2 BINDING SITE, designated SEQ ID:3559, to the nucleotide sequence of VGAM29 RNA, herein designated VGAM RNA, also designated SEQ ID:364.

[0504] Another function of VGAM29 is therefore inhibition of Dishevelled Associated Activator of Morphogenesis 2 (DAAM2, Accession XM_166434), a gene which controls cell polarity and movement during development. Accordingly, utilities of VGAM29 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DAAM2. The function of DAAM2 and its association with various diseases and clinical conditions, has been established by previous studies, as described here-

inabove with reference to VGAM15. Selectin E (endothelial adhesion molecule 1) (SELE, Accession NM_000450) is another VGAM29 host target gene. SELE BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SELE, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SELE BINDING SITE, designated SEQ ID:747, to the nucleotide sequence of VGAM29 RNA, herein designated VGAM RNA, also designated SEQ ID:364.

[0505] Another function of VGAM29 is therefore inhibition of Selectin E (endothelial adhesion molecule 1) (SELE, Accession NM_000450), a gene which expressed on cytokine induced endothelial cells and mediates their binding to leukocytes. Accordingly, utilities of VGAM29 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SELE. The function of SELE and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM15. KIAA0475 (Accession NM_014864) is another VGAM29 host target gene. KIAA0475 BINDING SITE is HOST TARGET binding

site found in the 3' untranslated region of mRNA encoded by KIAA0475, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0475 BINDING SITE, designated SEQ ID:1570, to the nucleotide sequence of VGAM29 RNA, herein designated VGAM RNA, also designated SEQ ID:364.

[0506] Another function of VGAM29 is therefore inhibition of KIAA0475 (Accession NM_014864). Accordingly, utilities of VGAM29 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0475. LOC222671 (Accession XM_167094) is another VGAM29 host target gene. LOC222671 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC222671, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222671 BINDING SITE, designated SEQ ID:3582, to the nucleotide sequence of VGAM29 RNA, herein designated VGAM RNA, also designated SEQ ID:364.

[0507] Another function of VGAM29 is therefore inhibition of

LOC222671 (Accession XM_167094). Accordingly, utilities of VGAM29 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222671. LOC254901 (Accession XM_171878) is another VGAM29 host target gene. LOC254901 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC254901, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254901 BINDING SITE, designated SEQ ID:3699, to the nucleotide sequence of VGAM29 RNA, herein designated VGAM RNA, also designated SEQ ID:364.

[0508] Another function of VGAM29 is therefore inhibition of LOC254901 (Accession XM_171878). Accordingly, utilities of VGAM29 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254901. LOC257615 (Accession XM_175293) is another VGAM29 host target gene. LOC257615 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC257615, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC257615 BINDING SITE, designated SEQ ID:3749, to the nucleotide sequence of VGAM29 RNA, herein designated VGAM RNA, also designated SEQ ID:364.

[0509] Another function of VGAM29 is therefore inhibition of LOC257615 (Accession XM_175293). Accordingly, utilities of VGAM29 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257615. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 30 (VGAM30) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[0510] VGAM30 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM30 was detected is described hereinabove with reference to Figs. 1–8.

[0511] VGAM30 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus. VGAM30 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[0512] VGAM30 gene encodes a VGAM30 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM30 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM30 precursor RNA is designated SEQ ID:16, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:16 is located at position 187719 relative to the genome of Vaccinia Virus.

[0513] VGAM30 precursor RNA folds onto itself, forming VGAM30 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[0514] An enzyme complex designated DICER COMPLEX, `dices` the VGAM30 folded precursor RNA into VGAM30 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 88%) nucleotide sequence of VGAM30 RNA is designated SEQ ID:365, and is provided hereinbelow with reference to the sequence listing part.

[0515] VGAM30 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM30 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM30 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[0516] VGAM30 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM30 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM30 RNA is an accurate or a partial inverted-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration,

Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM30 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM30 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR and 5' UTR regions.

[0517] The complementary binding of VGAM30 RNA, herein designated VGAM RNA, to host target binding sites on VGAM30 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM30 host target RNA into VGAM30 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[0518] It is appreciated that VGAM30 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM30 host target genes. The mRNA of each one of this plurality of VGAM30 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM30 RNA, herein designated VGAM RNA, and which when bound by VGAM30 RNA causes inhibition of translation of respective one or more VGAM30 host target proteins.

[0519] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM30 gene, herein designated VGAM GENE, on one or more VGAM30 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective:

Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[0520] It is yet further appreciated that a function of VGAM30 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM30 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM30 correlate with, and may be deduced from, the identity of the host target genes which VGAM30 binds and inhibits, and the function of these host target genes, as elaborated herein–below.

[0521] Nucleotide sequences of the VGAM30 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM30 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM30 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM30 are further described hereinbelow with reference to Table 1.

[0522] Nucleotide sequences of host target binding sites, such as BINDING SITE–I, BINDING SITE–II and BINDING SITE–III of Fig. 1, found on VGAM30 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM30 RNA, herein desig–

nated VGAM RNA, are described hereinbelow with reference to Table 2.

[0523] As mentioned hereinabove with reference to Fig. 1, a function of VGAM30 gene, herein designated VGAM is inhibition of expression of VGAM30 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM30 correlate with, and may be deduced from, the identity of the target genes which VGAM30 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[0524] Fibroblast Growth Factor 2 (basic) (FGF2, Accession NM_002006) is a VGAM30 host target gene. FGF2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FGF2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FGF2 BINDING SITE, designated SEQ ID:884, to the nucleotide sequence of VGAM30 RNA, herein designated VGAM RNA, also designated SEQ ID:365.

[0525] A function of VGAM30 is therefore inhibition of Fibroblast Growth Factor 2 (basic) (FGF2, Accession NM_002006), a gene which Basic fibroblast growth factor 2. Accordingly,

utilities of VGAM30 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FGF2. The function of FGF2 has been established by previous studies. FGF2 is a wide-spectrum mitogenic, angiogenic, and neurotrophic factor that is expressed at low levels in many tissues and cell types and reaches high concentrations in brain and pituitary. FGF2 has been implicated in a multitude of physiologic and pathologic processes, including limb development, angiogenesis, wound healing, and tumor growth Abraham et al. (1986) isolated a clone encoding FGFB from a bovine pituitary cDNA library. Southern blot analysis and genomic cloning of the human gene indicated that basic FGF is encoded by a single gene split by at least 2 introns of size greater than 15 kb (Abraham et al., 1986). Kurokawa et al. (1987) isolated a cDNA for basic FGF. The 4-kb cDNA had a coding sequence, 5-prime and 3-prime untranslated regions, and a poly(A) chain. Mergia et al. (1986) used a bovine basic FGF cDNA as a hybridization probe in Southern blot analysis of DNAs isolated from a panel of mouse-human cell hybrids. They concluded that FGFB is on chromosome 4, which carries other growth factors: EGF (OMIM Ref. No. 131530) and TCGF (OMIM Ref. No. 147680). Lafage-Pochitaloff et

al. (1990) mapped the FGFB gene to 4q26–q27 by in situ hybridization. By in situ hybridization to human metaphase and prometaphase chromosomes, Fukushima et al. (1990) concluded that the FGFB gene maps to 4q25. Using in situ chromosomal hybridization, Mattei et al. (1992) demonstrated that the corresponding gene in the mouse is on chromosome 3. Animal model experiments lend further support to the function of FGF2. To investigate the role of FGF2 in bone, Montero et al. (2000) examined mice with a disruption of the Fgf2 gene. They found a significant decrease in trabecular bone volume, mineral apposition, and bone formation rates. In addition, there was a profound decreased mineralization of bone marrow stromal cultures from Fgf2–deficient mice. The results showed that FGF2 helps determine bone mass as well as bone formation.

[0526] It is appreciated that the abovementioned animal model for FGF2 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[0527] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

- [0528] Abraham, J. A.; Mergia, A.; Whang, J. L.; Tumolo, A.; Friedman, J.; Hjerild, K. A.; Gospodarowicz, D.; Fiddes, J. C. : Nucleotide sequence of a bovine clone encoding the angiogenic protein, basic fibroblast growth factor. Science 233: 545–548, 1986. ; and
- [0529] Montero, A.; Okada, Y.; Tomita, M.; Ito, M.; Tsurukami, H.; Nakamura, T.; Doetschman, T.; Coffin, J. D.; Hurley, M. M. : Disruption of the fibroblast growth factor–2 gene results in dec.
- [0530] Further studies establishing the function and utilities of FGF2 are found in John Hopkins OMIM database record ID 134920, and in cited publications numbered 32–35, 2730–37, 609, 2731–41, 2732–4 and 2733 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. M-phase Phosphoprotein 1 (MPHOSPH1, Accession NM_016195) is another VGAM30 host target gene. MPHOSPH1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MPHOSPH1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MPHOSPH1 BINDING SITE, designated SEQ ID:1670, to the nucleotide sequence

of VGAM30 RNA, herein designated VGAM RNA, also designated SEQ ID:365.

[0531] Another function of VGAM30 is therefore inhibition of M-phase Phosphoprotein 1 (MPHOSPH1, Accession NM_016195), a gene which is Phosphorylated during M-phase and interacts with guanosine triphosphate. Accordingly, utilities of VGAM30 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MPHOSPH1. The function of MPHOSPH1 has been established by previous studies. By treating bacterial expression libraries with M-phase cytosol containing the relevant kinases, followed by immunoscreening with MPM2 antibody, Westendorf et al. (1994) isolated partial cDNAs encoding MPHOSPH1, which they termed MPP1, and MPHOSPH2, which they termed MPP2 (FOX M1; 602341). Sequence analysis predicted that the partial MPHOSPH1 cDNA encodes a 566-amino acid protein, the first 302 amino acids of which form a coiled-coil alpha helix. The authors determined that the MPM2 antibody-reactive sites of the MPHOSPH proteins consist of 5-amino acid stretches containing a hydrophobic residue, the putative phosphorylated residue (proline), another hydrophobic residue, and finally a basic or hydrophobic

residue (e.g., LTPLK).

[0532] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[0533] Matsumoto-Taniura, N.; Pirollet, F.; Monroe, R.; Gerace, L.; Westendorf, J. M. : Identification of novel M phase phosphoproteins by expression cloning. *Molec. Biol. Cell* 7: 1455-1469, 1996. ; and

[0535] Further studies establishing the function and utilities of MPHOSPH1 are found in John Hopkins OMIM database record ID 605498, and in cited publications numbered 165 and 1459 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. FLJ11274 (Accession NM_018375) is another VGAM30 host target gene. FLJ11274 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ11274, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complemen-

tarity of the nucleotide sequences of FLJ11274 BINDING SITE, designated SEQ ID:1820, to the nucleotide sequence of VGAM30 RNA, herein designated VGAM RNA, also designated SEQ ID:365.

[0536] Another function of VGAM30 is therefore inhibition of FLJ11274 (Accession NM_018375). Accordingly, utilities of VGAM30 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11274. FLJ31101 (Accession NM_017964) is another VGAM30 host target gene. FLJ31101 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ31101, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ31101 BINDING SITE, designated SEQ ID:1771, to the nucleotide sequence of VGAM30 RNA, herein designated VGAM RNA, also designated SEQ ID:365.

[0537] Another function of VGAM30 is therefore inhibition of FLJ31101 (Accession NM_017964). Accordingly, utilities of VGAM30 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ31101. Glutamic Pyruvate Transaminase (alanine aminotrans-

ferase) 2 (GPT2, Accession NM_133443) is another VGAM30 host target gene. GPT2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GPT2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GPT2 BINDING SITE, designated SEQ ID:2417, to the nucleotide sequence of VGAM30 RNA, herein designated VGAM RNA, also designated SEQ ID:365.

[0538] Another function of VGAM30 is therefore inhibition of Glutamic Pyruvate Transaminase (alanine aminotransferase) 2 (GPT2, Accession NM_133443). Accordingly, utilities of VGAM30 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GPT2. RMP (Accession NM_134447) is another VGAM30 host target gene. RMP BINDING SITE1 and RMP BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by RMP, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RMP BINDING SITE1 and RMP BINDING SITE2, designated SEQ ID:2430

and SEQ ID:1059 respectively, to the nucleotide sequence of VGAM30 RNA, herein designated VGAM RNA, also designated SEQ ID:365.

[0539] Another function of VGAM30 is therefore inhibition of RMP (Accession NM_134447). Accordingly, utilities of VGAM30 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RMP. LOC136288 (Accession XM_059832) is another VGAM30 host target gene. LOC136288 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC136288, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC136288 BINDING SITE, designated SEQ ID:3018, to the nucleotide sequence of VGAM30 RNA, herein designated VGAM RNA, also designated SEQ ID:365.

[0540] Another function of VGAM30 is therefore inhibition of LOC136288 (Accession XM_059832). Accordingly, utilities of VGAM30 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC136288. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the

present invention, referred to here as Viral Genomic Address Messenger 31 (VGAM31) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[0541] VGAM31 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM31 was detected is described hereinabove with reference to Figs. 1–8.

[0542] VGAM31 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus. VGAM31 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[0543] VGAM31 gene encodes a VGAM31 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM31 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM31 precursor RNA is designated SEQ ID:17, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:17 is located at position 188420 relative to the genome of Vaccinia Virus.

[0544] VGAM31 precursor RNA folds onto itself, forming VGAM31 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[0545] An enzyme complex designated DICER COMPLEX, `dices` the VGAM31 folded precursor RNA into VGAM31 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM31 RNA is designated SEQ ID:366, and is provided hereinbelow with reference to the sequence listing part.

[0546] VGAM31 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM31 host target RNA, herein designated VGAM HOST

TARGET RNA. VGAM31 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[0547] VGAM31 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM31 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM31 RNA is an accurate or a partial inverted-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM31 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM31 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region,

this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[0548] The complementary binding of VGAM31 RNA, herein designated VGAM RNA, to host target binding sites on VGAM31 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM31 host target RNA into VGAM31 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[0549] It is appreciated that VGAM31 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM31 host target genes. The mRNA of each one of this plurality of VGAM31 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM31 RNA, herein designated VGAM RNA, and which when bound by VGAM31 RNA causes inhibition of translation of respective one or more VGAM31 host target proteins.

[0550] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM31 gene, herein designated VGAM GENE, on one or more VGAM31 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[0551] It is yet further appreciated that a function of VGAM31 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM31 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM31 correlate with, and may be deduced from, the identity of the host target genes which VGAM31 binds and inhibits, and the function of these host target genes, as elaborated herein—

below.

[0552] Nucleotide sequences of the VGAM31 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM31 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM31 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM31 are further described hereinbelow with reference to Table 1.

[0553] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM31 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM31 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[0554] As mentioned hereinabove with reference to Fig. 1, a function of VGAM31 gene, herein designated VGAM is inhibition of expression of VGAM31 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM31 correlate with, and may be deduced from, the identity of the target genes which VGAM31 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[0555] Activation-induced Cytidine Deaminase (AICDA, Accession NM_020661) is a VGAM31 host target gene. AICDA BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by AICDA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AICDA BINDING SITE, designated SEQ ID:1922, to the nucleotide sequence of VGAM31 RNA, herein designated VGAM RNA, also designated SEQ ID:366.

[0556] A function of VGAM31 is therefore inhibition of Activation-induced Cytidine Deaminase (AICDA, Accession NM_020661), a gene which is a member of the cytidine deaminase family. Accordingly, utilities of VGAM31 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AICDA. The function of AICDA has been established by previous studies. Muramatsu et al. (1999) isolated the gene encoding activation-induced cytidine deaminase (Aid), a member of the cytidine deaminase family, from a murine B-cell lymphoma line induced by combined stimulation of transforming growth factor-beta (TGFB; 190180), interleukin-4 (IL4; 147780), and CD40 ligand (CD40L; 300386). Muto et al.

(2000) isolated the human AID gene, which encodes a 198-amino acid protein containing a conserved cytidine deaminase motif. The human AID protein shares 92% amino acid identity with mouse Aid. RT-PCR analysis of 15 human tissues detected strong expression of AID mRNA in lymph nodes and tonsils. Petersen-Mahrt et al. (2002) hypothesized that the 3 gene diversification processes mediated by AICDA, somatic hypermutation, gene conversion, and class-switch recombination, may be initiated by DNA lesions at dC/dG pairs by AICDA, which has sequence homology to the RNA editing enzyme APOBEC1 (OMIM Ref. No. 600130). Expression of AICDA in *E. coli* confers a mutator phenotype yielding nucleotide transitions at dC/dG in a context-dependent manner. The mutation triggered by AICDA is enhanced by a deficiency of uracil-DNA glycosylase (UNG; 191525), indicating that AICDA functions by deaminating dC residues in DNA. Petersen-Mahrt et al. (2002) proposed that diversification of functional Ig genes is triggered by AICDA-mediated deamination of dC residues in the Ig locus with the outcome, i.e., hypermutation phases 1 and 2, gene conversion, or switch recombination, dependent on the way in which the initiating dU/dG lesion is resolved. Muto et al.

(2000) mapped the AID gene to 12p13 by FISH. Animal model experiments lend further support to the function of AICDA. Muramatsu et al. (2000) found that in the mouse, Aid deficiency caused a complete defect in class switching and showed a hyper-IgM phenotype with enlarged germinal centers containing strongly activated B cells before or after immunization. Mouse Aid $-/-$ spleen cells stimulated in vitro with lipopolysaccharide (LPS) and cytokines failed to undergo CSR, although they expressed germline transcripts.

[0557] It is appreciated that the abovementioned animal model for AICDA is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[0558] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[0559] Muramatsu, M.; Sankaranand, V. S.; Anant, S.; Sugai, M.; Kinoshita, K.; Davidson, N. O.; Honjo, T. : Specific expression of activation-induced cytidine deaminase (AID), a novel member of the RNA-editing deaminase family in germinal center B cells. J. Biol. Chem. 274: 18470–18476, 1999. ; and

[0560] Muramatsu, M.; Kinoshita, K.; Fagarasan, S.; Yamada, S.; Shinkai, Y.; Honjo, T. : Class switch recombination and hypermutation require activation-induced cytidine deaminase (AID), a pot.

[0561] Further studies establishing the function and utilities of AICDA are found in John Hopkins OMIM database record ID 605257, and in cited publications numbered 984–987, 106 and 2054–531 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. AS3 (Accession NM_015928) is another VGAM31 host target gene. AS3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by AS3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AS3 BINDING SITE, designated SEQ ID:1652, to the nucleotide sequence of VGAM31 RNA, herein designated VGAM RNA, also designated SEQ ID:366.

[0562] Another function of VGAM31 is therefore inhibition of AS3 (Accession NM_015928), a gene which inhibits cell proliferation. Accordingly, utilities of VGAM31 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AS3. The function of AS3 has

been established by previous studies. In the prostate of adult mammals, most epithelial cells are in a state of proliferative quiescence. Androgens regulate this effect by inducing cell cycle arrest in the G0/G1 phase. Geck et al. (2000) identified potential mediators of this androgen-induced proliferative shutoff by means of subtractive cDNA libraries. The expression pattern of one of these sequences, designated AS3, strongly correlated with the expression of the androgen-induced proliferative shutoff both temporally and dosewise. The AS3 gene is upregulated during androgen-induced proliferative shutoff and induces cell proliferation arrest when expressed in a retrovirus transduced model. The deduced 1,391-amino acid AS3 protein has putative transactivating features, protein-protein interaction motifs (coiled coil and leucine zipper), and DNA-binding domains, suggesting that AS3 is a transcription factor. AS3 also has a protein-kinase motif, suggesting that it may act by phosphorylating a target protein. Geck et al. (1999) demonstrated that the transcript of the AS3 gene has 34 exons spanning approximately 200 kb of genomic DNA. By homology searching in GenBank, they demonstrated that the AS3 gene lies on 13q12-q13, downstream of the breast cancer

susceptibility gene BRCA2 (OMIM Ref. No. 600185) and centromeric to the retinoblastoma (RB1; 180200) locus. Geck et al. (2001) presented data on the location of the AS3 gene in relation to BRCA2 and pointed out that the D13S171 marker, which had been widely used as an intra-genic marker of BRCA2, is actually located in the center of the 200-kb AS3 gene. The microsatellite instability of the S171 marker links the AS3 gene to a variety of cancers.

[0563] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[0564] Geck, P.; Sonnenschein, C.; Soto, A. M. : The D13S171 marker, misannotated to BRCA2, links the AS3 gene to various cancers. (Letter) Am. J. Hum. Genet. 69: 461–463, 2001. ; and

[0565] Geck, P.; Szelei, J.; Jimenez, J.; Sonnenschein, C.; Soto, A. M. : Early gene expression during androgen-induced inhibition of proliferation of prostate cancer cells: a new suppressor.

[0566] Further studies establishing the function and utilities of AS3 are found in John Hopkins OMIM database record ID 605333, and in cited publications numbered 1070–527 listed in the bibliography section hereinbelow, which are

also hereby incorporated by reference. Epilepsy, Progressive Myoclonus Type 2, Lafora Disease (laforin) (EPM2A, Accession NM_005670) is another VGAM31 host target gene. EPM2A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EPM2A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EPM2A BINDING SITE, designated SEQ ID:1234, to the nucleotide sequence of VGAM31 RNA, herein designated VGAM RNA, also designated SEQ ID:366.

[0567] Another function of VGAM31 is therefore inhibition of Epilepsy, Progressive Myoclonus Type 2, Lafora Disease (laforin) (EPM2A, Accession NM_005670), a gene which Laforin; protein tyrosine phosphatase that may have role in glycogen metabolism. Accordingly, utilities of VGAM31 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EPM2A. The function of EPM2A has been established by previous studies. In the Lafora type, onset takes the form of grand mal seizures and/or myoclonus at about age 15 years. Rapid and severe mental deterioration ensues, often with psy-

chotic features. Survival is short, less than 10 years after onset. Histologic study of the brain shows Lafora bodies (which may also be demonstrable on muscle and liver biopsy). Intracellular Lafora bodies suggesting amyloid are found in the brain, and similar inclusions in the cells of the heart and liver (Harriman and Millar, 1955). The Lafora material has the properties of an acid mucopolysaccharide. Yokoi et al. (1968) arrived at a preliminary conclusion that the Lafora body is polyglucosan in nature. They pictured the existence of an enzyme defect which leads to deposition of polyglucosans near their site of synthesis in the agranular endoplasmic reticulum. Schwarz and Yanoff (1965) described a brother and sister, offspring of a one-and-one-half cousin marriage, with this disease. Seizures began at age 15 in the boy with slowly progressive motor and mental deterioration leading to death at age 23.5 years. The sister's seizures began at age 14 years and progression to dementia and blindness occurred, with death at age 19. Intra- and extracellular Lafora bodies were found in the CNS, retina, axis cylinders of spinal nerves, heart muscle, liver cells, and striated muscle fibers. Diagnosis by liver or muscle biopsy was proposed. Busard et al. (1986, 1987) demonstrated that the diagno-

sis can be made reliably on axillary skin biopsy; all patients show typical periodic acid–Schiff (PAS)–positive inclusions in the myoepithelial cells of the secretory acini of the apocrine glands and/or in the cells of the eccrine duct. The method has no value for carrier detection. In cultured fibroblasts, Fluharty et al. (1970) described bodies which may be the equivalent of the Lafora body observed histologically. Sarlin et al. (1960) claimed that electroencephalographic abnormalities distinguished heterozygotes from homozygous normals. Norio and Koskiniemi (1979), as well as others, have concluded that there are 3 types of what they termed progressive myoclonic epilepsy (PME). The Lafora type shows onset of grand mal seizures and/or myoclonus around the fifteenth year of life; rapid and severe mental deterioration, often with psychotic symptoms; short survival; histologic finding of Lafora bodies; and autosomal recessive inheritance. The Unverricht–Lundborg type (EPM1; 254800), which is frequent in Finland, has onset around the tenth year; variable severity; progressive incapacitation from myoclonus associated with mild mental symptoms; variable survival; 'degenerative' histologic changes; and autosomal recessive inheritance. A dominant form, to which Hartung's name is attached (see OMIM Ref.

No. 159600), has been described. By linkage studies in 3 Italian families with Lafora disease, Lehesjoki et al. (1992) demonstrated that the gene is located at a locus other than that for the Unverricht–Lundborg type on chromosome 21q22.3. Serratosa et al. (1995) studied linkage in 9 families in which Lafora disease had been proven by biopsy in at least 1 member. Using microsatellite markers spaced an average of 13 cM apart, they used linkage analysis in all 9 families and homozygosity mapping in 4 consanguineous families to assign the gene for Lafora disease to 6q23–q25. An extended pedigree with 5 affected members independently proved linkage. The multipoint 1–lod unit support interval covered a 2.5–cM region surrounding D6S403. Homozygosity mapping defined a 17–cM region in 6q23–q25 flanked by D6S292 and D6S420. The 9 families with a total of 19 patients affected with Lafora disease originated from the United States, Spain, Palestine, and Iran. Maddox et al. (1997) studied a 2–generation family in which a recombination event reduced the Lafora critical region to a 4–cM interval flanked by markers D6S308 and D6S311. Sainz et al. (1997) narrowed the assignment of the MELF locus within 6q24 by study of recombinants and homozygosities. Ganesh et al.

(2000) cloned and expressed the full-length 38-kD laforin protein in transfected cells. Recombinant laforin was able to hydrolyze phosphotyrosine as well as phosphoserine/threonine substrates, demonstrating that laforin is an active dual-specificity phosphatase. Biochemical, immunofluorescence, and ultrastructural studies on transfected HeLa cells revealed that laforin is a cytoplasmic protein associated with polyribosomes. Expression of 2 proteins with missense mutations seen in EPM2A patients resulted in ubiquitin-positive perinuclear aggregates, suggesting that these were misfolded proteins targeted for degradation. The authors suggested that laforin is involved in translational regulation and that protein misfolding may be one of the molecular bases of the Lafora disease phenotype caused by missense mutations in the EPM2A gene.

Gomez-Garre et al. (2000) reported the complete coding sequence of the EPM2A gene, including the ATG initiation codon region. They used SSCP analysis of the 4 exons in 34 unrelated patients with Lafora disease and identified EPM2A mutations in 27 (79%) of them (49 of 68 chromosomes, or 72%). The patients originated from Spain, Italy, Australia, Holland, the US, North Africa, Turkey, and France. A total of 20 different EPM2A mutations, 11 of

them novel, were characterized. The authors summarized 25 EPM2A mutations distributed throughout the gene in 44 unrelated Lafora disease patients. The mutations included 10 deletions of different sizes, 9 missense mutations, 3 nonsense mutations, and 3 frameshift mutations. The R241X mutation (254780.0008) was encountered in almost 40% of the probands. In 5 Lafora disease families (13% of the families studied), Gomez-Garre et al. (2000) excluded linkage to the EPM2A gene region.

[0568] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[0569] Norio, R.; Koskiniemi, M. : Progressive myoclonus epilepsy: genetic and nosological aspects with special reference to 107 Finnish patients. Clin. Genet. 15: 382–398, 1979. ; and

[0570] Gomez-Garre, P.; Sanz, Y.; Rodriguez de Cordoba, S.; Ser-ratosa, J. M. : Mutational spectrum of the EPM2A gene in progressive myoclonus epilepsy of Lafora: high degree of allelic heterogen.

[0571] Further studies establishing the function and utilities of EPM2A are found in John Hopkins OMIM database record ID 254780, and in sited publications numbered

2041–2049, 2069–207 and 2078–2077 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Histamine Receptor H1 (HRH1, Accession NM_000861) is another VGAM31 host target gene. HRH1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HRH1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HRH1 BINDING SITE, designated SEQ ID:780, to the nucleotide sequence of VGAM31 RNA, herein designated VGAM RNA, also designated SEQ ID:366.

[0572] Another function of VGAM31 is therefore inhibition of Histamine Receptor H1 (HRH1, Accession NM_000861), a gene which stimulates the synthesis of inositol phosphate. Accordingly, utilities of VGAM31 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HRH1. The function of HRH1 has been established by previous studies. Histamine is a ubiquitous messenger molecule released from mast cells, enterochromaffin-like cells, and neurons. Its various actions are mediated by 3 pharmacologically defined receptors termed the H1, H2 (OMIM Ref. No. 142703), and H3

(OMIM Ref. No. 604525) receptors. The H1 receptor was the first member of this family to be pharmacologically defined with the design of selective antagonists, the 'anti-histamines,' which are used to treat allergic and inflammatory reactions. The H1 receptor is expressed by various peripheral tissues, such as smooth muscle, and by neurons in the brain, where histamine may be involved in the control of wakefulness, mood, and hormone secretion. Yamashita et al. (1991) cloned a bovine H1 receptor cDNA and established its nucleotide sequence. Its homology with the corresponding sequence of other receptors confirmed that it belongs to the superfamily of receptors coupled with G proteins with 7 putative transmembrane domains. In addition to their expression in neuronal, gastric, and muscular tissue, the G protein-coupled receptors HRH1 and HRH2 are also expressed on T-helper lymphocytes and trigger different intracellular events upon activation. Using flow cytometric analysis, Jutel et al. (2001) demonstrated that histamine binds more strongly to Th1 than to Th2 cells. Flow cytometry and RT-PCR analysis showed that HRH1 is predominantly expressed on Th1 cells in an IL3 (OMIM Ref. No. 147740)-upregulatable manner, while HRH2 is predominant on Th2 cells. Stimu-

lation of naive, CD45RA⁺ (see OMIM Ref. No. 151460) T cells with IL12 (OMIM Ref. No. 161560) resulted in preferential expression of HRH1, but stimulation with IL4 (OMIM Ref. No. 147780) resulted in suppressed expression of HRH1, demonstrating that mature CD45RO⁺ Th1 and Th2 lymphocytes preferentially but not exclusively express HRH1 and HRH2, and that HRH1 and HRH2 are regulated by cytokines present in the immune environment. Histamine stimulation of Th1 cells resulted in significant calcium flux that could be blocked by an HRH1 antagonist, while stimulation of Th2 cells led to cAMP formation that could be blocked by an HRH2, but not an HRH1, antagonist. Furthermore, histamine enhanced Th1 but inhibited Th2 responses to anti-CD3. Histamine also enhanced peripheral blood mononuclear cell responses in sensitized individuals to a predominantly Th1 antigen, but suppressed responses to Th2 allergens. Animal model experiments lend further support to the function of HRH1. Ma et al. (2002) noted that pertussis toxin (PTX) elicits a range of responses in mice, including sensitization to vasoactive amines (VAAS) and increased vascular permeability subsequent to PTX-induced changes in vascular endothelial cells. Susceptible mouse strains die from hy-

potensive and hypovolemic shock on vasoactive amine challenge, whereas resistant strains do not. This hypersensitivity is controlled by an autosomal dominant locus, designated Bphs, localized to mouse chromosome 6. Using positional cloning, Ma et al. (2002) linked the Bphs locus to Hrh1. Mice lacking Hrh1 were protected from VAAS hypersensitivity, as well as from experimental allergic encephalomyelitis and experimental autoimmune orchitis. Sequence analysis showed that leu263-to-pro (L263P), met313-to-val (M313V), and ser331-to-pro (S331P) polymorphisms were associated with resistance to vasoactive amine challenge. The authors concluded that these Hrh1 alleles control both the autoimmune T-cell and vascular responses regulated by histamine after PTX sensitization.

[0573] It is appreciated that the abovementioned animal model for HRH1 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[0574] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[0575] Jutel, M.; Watanabe, T.; Klunker, S.; Akdis, M.; Thomet, O. A. R.; Malolepszy, J.; Zak-Nejmark, T.; Koga, R.;

[0576] Ma, R. Z.; Gao, J.; Meeker, N. D.; Fillmore, P. D.; Tung, K. S. K.; Watanabe, T.; Zachary, J. F.; Offner, H.; Blankenhorn, E. P.; Teuscher, C. : Identification of Bphs, an autoimmune di.

[0577] Further studies establishing the function and utilities of HRH1 are found in John Hopkins OMIM database record ID 600167, and in cited publications numbered 179 and 1798–1800 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Mitogen-activated Protein Kinase 14 (MAPK14, Accession NM_001315) is another VGAM31 host target gene. MAPK14 BINDING SITE1 through MAPK14 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by MAPK14, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAPK14 BINDING SITE1 through MAPK14 BINDING SITE3, designated SEQ ID:818, SEQ ID:2465 and SEQ ID:2466 respec-

tively, to the nucleotide sequence of VGAM31 RNA, herein designated VGAM RNA, also designated SEQ ID:366.

[0578] Another function of VGAM31 is therefore inhibition of Mitogen-activated Protein Kinase 14 (MAPK14, Accession NM_001315), a gene which is important for cytokine production; responds to changes in extracellular osmolarity. Accordingly, utilities of VGAM31 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAPK14. The function of MAPK14 has been established by previous studies. Tamura et al. (2000) investigated a role for Mapk14 in mouse development and physiology by targeted disruption of the Mapk14 gene. Whereas some Mapk14 $-/-$ embryos died between embryonic days 11.5 and 12.5, those that developed past this stage had normal morphology but were anemic, owing to failed definitive erythropoiesis caused by diminished expression of the erythropoietin gene (EPO; 133170). Since Mapk14-deficient hematopoietic stem cells reconstituted lethally irradiated hosts, Mapk14 function is not required downstream of the Epo receptor (EPOR; 133171). Inhibition of MAPK14 activity also interfered with stabilization of EPO mRNA in human hepatoma cells undergoing hypoxic stress. The authors concluded that MAPK14 plays a

critical role linking developmental and stress-induced erythropoiesis through regulation of EPO expression. Using a yeast 2-hybrid screen of gastrointestinal tract tissue with p38-alpha as the bait, Ge et al. (2002) isolated multiple clones encoding TAB1 (OMIM Ref. No. 602615). Immunoprecipitation and GST pull-down analyses indicated that TAB1 interacts with p38-alpha, but not with other MAPKs, with or without treatment with TNF. Immunoblot analysis showed that coexpression of TAB1 and p38-alpha enhanced autophosphorylation of p38-alpha even in the presence of dominant-negative forms of MAP2Ks (e.g., MAP2K3; 602315) and TAK1 (MAP3K7; 602614). The amino acids between positions 373 and 418 of TAB1 were found to be required for phosphorylation of p38-alpha. Expression of TLR2 (OMIM Ref. No. 603028) caused p38-alpha phosphorylation in the presence or absence of inhibitors, whereas p38-alpha phosphorylation after stimulation of TLR4 (OMIM Ref. No. 603030) could be inhibited by mutant TAB1, suggesting that activation of p38-alpha can be TAB1 dependent or independent. Immunoblot analysis detected the formation of TRAF6 (OMIM Ref. No. 602355)-TAB1-p38-alpha complexes. Formation of these complexes could be enhanced by stimulation with

lipopolysaccharide. Ge et al. (2002) concluded that activation of p38-alpha by a nonenzymatic adaptor protein such as TAB1 may be an important alternative activation pathway operating in parallel with kinase cascades in regulating intracellular signaling

- [0579] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

- [0582] Further studies establishing the function and utilities of MAPK14 are found in John Hopkins OMIM database record ID 600289, and in cited publications numbered 2292, 2293, 2294-230 and 2541 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Single-minded Homolog 1 (Drosophila) (SIM1, Accession NM_005068) is another VGAM31 host target

gene. SIM1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SIM1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SIM1 BINDING SITE, designated SEQ ID:1181, to the nucleotide sequence of VGAM31 RNA, herein designated VGAM RNA, also designated SEQ ID:366.

[0583] Another function of VGAM31 is therefore inhibition of Single-minded Homolog 1 (Drosophila)(SIM1, Accession NM_005068), a gene which may have pleiotropic effects during embryogenesis and in the adult. Accordingly, utilities of VGAM31 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SIM1. The function of SIM1 has been established by previous studies. Studies of mice and humans have revealed a number of genes that when mutated result in severe obesity. Holder et al. (2000) studied a girl with early-onset obesity and a balanced translocation between 1p22.1 and 6q16.2. At 67 months of age she weighed 47.5 kg (+9.3 SD) and was 127.2 cm tall (+3.2 SD); her weight for height was +6.3 SD. The child displayed an aggressive, voracious appetite, and the obesity was thought to be due to high

intake, since measured energy expenditure was normal. Holder et al. (2000) cloned and sequenced both translocation breakpoints. The translocation did not appear to affect any transcription unit on 1p, but it disrupted the SIM1 gene on 6q, separating the 5-prime promoter region and the bHLH domain from the 3-prime PAS and putative transcriptional regulation domains. The transcriptional targets of SIM1 were not known. Mouse Sim1 is expressed in the developing kidney and central nervous system and is essential for formation of the supraoptic and paraventricular (PVN) nuclei of the hypothalamus. Previous neuroanatomic and pharmacologic studies had implicated the PVN in the regulation of body weight: PVN neurons express the melanocortin-4 receptor (MC4R; 155541) and appear to be physiologic targets of alpha-melanocyte-stimulating hormone (OMIM Ref. No. 176830), which inhibits food intake. Holder et al. (2000) hypothesized that haploinsufficiency of SIM1, possibly acting upstream or downstream of MC4R in the PVN, was responsible for severe obesity in their patient. Animal model experiments lend further support to the function of SIM1. Mice homozygous for a null allele of Sim1 (Sim1 -/-) lack a paraventricular nucleus (PVN) and die perina-

tally. In contrast, Michaud et al. (2001) showed that Sim1 heterozygous mice were viable but developed early-onset obesity, with increased linear growth, hyperinsulinemia, and hyperleptinemia. Sim1 +/- mice were hyperphagic but their energy expenditure was not decreased, distinguishing them from other mouse models of early-onset obesity such as deficiencies in leptin (OMIM Ref. No. 164160) and melanocortin receptor-4 (OMIM Ref. No. 155541). Quantitative histologic comparison with normal littermates showed that the PVN of Sim1 +/- mice contains on average 24% fewer cells without a selective loss of any identifiable major cell type. Since acquired lesions in the PVN also induce increased appetite without a decrease in energy expenditure, the authors proposed that abnormalities of PVN development may cause the obesity of Sim1 +/- mice.

[0584] It is appreciated that the abovementioned animal model for SIM1 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[0585] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[0586] Holder, J. L., Jr.; Butte, N. F.; Zinn, A. R. : Profound obesity associated with a balanced translocation that disrupts the SIM1 gene. Hum. Molec. Genet. 9: 101–108, 2000. ; and

[0587] Michaud, J. L.; Boucher, F.; Melnyk, A.; Gauthier, F.; Goshu, E.; Levy, E.; Mitchell, G. A.; Himms–Hagen, J.; Fan, C.–M. : Sim1 haploinsufficiency causes hyperphagia, obesity and redu.

[0588] Further studies establishing the function and utilities of SIM1 are found in John Hopkins OMIM database record ID 603128, and in cited publications numbered 12 and 129–128 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Chromosome 11 Open Reading Frame 25 (C11orf25, Accession NM_031418) is another VGAM31 host target gene. C11orf25 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by C11orf25, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C11orf25 BINDING SITE, designated SEQ ID:2193, to the nucleotide sequence of VGAM31 RNA, herein designated VGAM RNA, also designated SEQ ID:366.

[0589] Another function of VGAM31 is therefore inhibition of Chromosome 11 Open Reading Frame 25 (C11orf25, Accession NM_031418). Accordingly, utilities of VGAM31 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C11orf25. DKFZP564D116 (Accession XM_051050) is another VGAM31 host target gene. DKFZP564D116 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP564D116, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP564D116 BINDING SITE, designated SEQ ID:2938, to the nucleotide sequence of VGAM31 RNA, herein designated VGAM RNA, also designated SEQ ID:366.

[0590] Another function of VGAM31 is therefore inhibition of DKFZP564D116 (Accession XM_051050). Accordingly, utilities of VGAM31 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP564D116. Down Syndrome Critical Region Gene 6 (DSCR6, Accession NM_018962) is another VGAM31 host target gene. DSCR6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded

by DSCR6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DSCR6 BINDING SITE, designated SEQ ID:1866, to the nucleotide sequence of VGAM31 RNA, herein designated VGAM RNA, also designated SEQ ID:366.

[0591] Another function of VGAM31 is therefore inhibition of Down Syndrome Critical Region Gene 6 (DSCR6, Accession NM_018962). Accordingly, utilities of VGAM31 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DSCR6. FLJ10006 (Accession XM_087073) is another VGAM31 host target gene. FLJ10006 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10006, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10006 BINDING SITE, designated SEQ ID:3152, to the nucleotide sequence of VGAM31 RNA, herein designated VGAM RNA, also designated SEQ ID:366.

[0592] Another function of VGAM31 is therefore inhibition of

FLJ10006 (Accession XM_087073). Accordingly, utilities of VGAM31 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10006. HTPAP (Accession NM_032483) is another VGAM31 host target gene. HTPAP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HTPAP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HTPAP BINDING SITE, designated SEQ ID:2255, to the nucleotide sequence of VGAM31 RNA, herein designated VGAM RNA, also designated SEQ ID:366.

[0593] Another function of VGAM31 is therefore inhibition of HTPAP (Accession NM_032483). Accordingly, utilities of VGAM31 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HTPAP. KIAA0979 (Accession NM_015032) is another VGAM31 host target gene. KIAA0979 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0979, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of KIAA0979 BINDING SITE, designated SEQ ID:1601, to the nucleotide sequence of VGAM31 RNA, herein designated VGAM RNA, also designated SEQ ID:366.

[0594] Another function of VGAM31 is therefore inhibition of KIAA0979 (Accession NM_015032). Accordingly, utilities of VGAM31 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0979. KIAA1634 (Accession XM_032749) is another VGAM31 host target gene. KIAA1634 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1634, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1634 BINDING SITE, designated SEQ ID:2657, to the nucleotide sequence of VGAM31 RNA, herein designated VGAM RNA, also designated SEQ ID:366.

[0595] Another function of VGAM31 is therefore inhibition of KIAA1634 (Accession XM_032749). Accordingly, utilities of VGAM31 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1634. PTD012 (Accession NM_014039) is another

VGAM31 host target gene. PTD012 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PTD012, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PTD012 BINDING SITE, designated SEQ ID:1465, to the nucleotide sequence of VGAM31 RNA, herein designated VGAM RNA, also designated SEQ ID:366.

[0596] Another function of VGAM31 is therefore inhibition of PTD012 (Accession NM_014039). Accordingly, utilities of VGAM31 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTD012. SAM Domain and HD Domain 1 (SAMHD1, Accession XM_028704) is another VGAM31 host target gene. SAMHD1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SAMHD1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SAMHD1 BINDING SITE, designated SEQ ID:2593, to the nucleotide sequence of VGAM31 RNA, herein designated VGAM RNA, also designated SEQ

ID:366.

[0597] Another function of VGAM31 is therefore inhibition of SAM Domain and HD Domain 1 (SAMHD1, Accession XM_028704). Accordingly, utilities of VGAM31 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SAMHD1. LOC196758 (Accession XM_113600) is another VGAM31 host target gene. LOC196758 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC196758, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC196758 BINDING SITE, designated SEQ ID:3410, to the nucleotide sequence of VGAM31 RNA, herein designated VGAM RNA, also designated SEQ ID:366.

[0598] Another function of VGAM31 is therefore inhibition of LOC196758 (Accession XM_113600). Accordingly, utilities of VGAM31 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196758. LOC219790 (Accession XM_166124) is another VGAM31 host target gene. LOC219790 BINDING SITE is HOST TARGET binding site found in the 3' un-

translated region of mRNA encoded by LOC219790, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219790 BINDING SITE, designated SEQ ID:3520, to the nucleotide sequence of VGAM31 RNA, herein designated VGAM RNA, also designated SEQ ID:366.

[0599] Another function of VGAM31 is therefore inhibition of LOC219790 (Accession XM_166124). Accordingly, utilities of VGAM31 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219790. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 32 (VGAM32) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[0600] VGAM32 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM32 was detected is described hereinabove with reference to Figs. 1–8.

[0601] VGAM32 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Vaccinia Virus. VGAM32 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[0602] VGAM32 gene encodes a VGAM32 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM32 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM32 precursor RNA is designated SEQ ID:18, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:18 is located at position 190813 relative to the genome of Vaccinia Virus.

[0603] VGAM32 precursor RNA folds onto itself, forming VGAM32 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[0604] An enzyme complex designated DICER COMPLEX, `dices`

the VGAM32 folded precursor RNA into VGAM32 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of VGAM32 RNA is designated SEQ ID:367, and is provided hereinbelow with reference to the sequence listing part.

[0605] VGAM32 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM32 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM32 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[0606] VGAM32 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM32 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide

sequence of VGAM32 RNA is an accurate or a partial inverted-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM32 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM32 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR and 5' UTR regions.

[0607] The complementary binding of VGAM32 RNA, herein designated VGAM RNA, to host target binding sites on VGAM32 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM32 host target RNA into VGAM32 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target

protein is therefore outlined by a broken line.

[0608] It is appreciated that VGAM32 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM32 host target genes. The mRNA of each one of this plurality of VGAM32 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM32 RNA, herein designated VGAM RNA, and which when bound by VGAM32 RNA causes inhibition of translation of respective one or more VGAM32 host target proteins.

[0609] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM32 gene, herein designated VGAM GENE, on one or more VGAM32 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression

of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[0610] It is yet further appreciated that a function of VGAM32 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM32 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM32 correlate with, and may be deduced from, the identity of the host target genes which VGAM32 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[0611] Nucleotide sequences of the VGAM32 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM32 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM32 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM32 are further described hereinbelow with reference to Table 1.

[0612] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on VGAM32 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM32 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[0613] As mentioned hereinabove with reference to Fig. 1, a function of VGAM32 gene, herein designated VGAM is inhibition of expression of VGAM32 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM32 correlate with, and may be deduced from, the identity of the target genes which VGAM32 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[0614] Calpain 2, (m/II) Large Subunit (CAPN2, Accession NM_001748) is a VGAM32 host target gene. CAPN2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CAPN2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CAPN2 BINDING SITE, designated SEQ ID:855, to the nucleotide sequence of VGAM32 RNA, herein designated VGAM RNA, also designated SEQ ID:367.

[0615] A function of VGAM32 is therefore inhibition of Calpain 2, (m/II) Large Subunit (CAPN2, Accession NM_001748). Accordingly, utilities of VGAM32 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CAPN2. Dishevelled Associated Activator of Morphogenesis 2 (DAAM2, Accession XM_166434) is another VGAM32 host target gene. DAAM2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DAAM2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DAAM2 BINDING SITE, designated SEQ ID:3559, to the nucleotide sequence of VGAM32 RNA, herein designated VGAM RNA, also designated SEQ ID:367.

[0616] Another function of VGAM32 is therefore inhibition of Dishevelled Associated Activator of Morphogenesis 2 (DAAM2, Accession XM_166434), a gene which controls cell polarity and movement during development. Accordingly, utilities of VGAM32 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DAAM2. The function of DAAM2 and its association with various diseases and clinical conditions, has

been established by previous studies, as described hereinabove with reference to VGAM15. Selectin E (endothelial adhesion molecule 1) (SELE, Accession NM_000450) is another VGAM32 host target gene. SELE BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SELE, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SELE BINDING SITE, designated SEQ ID:747, to the nucleotide sequence of VGAM32 RNA, herein designated VGAM RNA, also designated SEQ ID:367.

[0617] Another function of VGAM32 is therefore inhibition of Selectin E (endothelial adhesion molecule 1) (SELE, Accession NM_000450), a gene which expressed on cytokine induced endothelial cells and mediates their binding to leukocytes. Accordingly, utilities of VGAM32 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SELE. The function of SELE and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM15. KIAA0475 (Accession NM_014864) is another VGAM32 host target

gene. KIAA0475 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0475, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0475 BINDING SITE, designated SEQ ID:1570, to the nucleotide sequence of VGAM32 RNA, herein designated VGAM RNA, also designated SEQ ID:367.

[0618] Another function of VGAM32 is therefore inhibition of KIAA0475 (Accession NM_014864). Accordingly, utilities of VGAM32 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0475. LOC222671 (Accession XM_167094) is another VGAM32 host target gene. LOC222671 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC222671, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222671 BINDING SITE, designated SEQ ID:3582, to the nucleotide sequence of VGAM32 RNA, herein designated VGAM RNA, also designated SEQ ID:367.

[0619] Another function of VGAM32 is therefore inhibition of LOC222671 (Accession XM_167094). Accordingly, utilities of VGAM32 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222671. LOC254901 (Accession XM_171878) is another VGAM32 host target gene. LOC254901 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC254901, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254901 BINDING SITE, designated SEQ ID:3699, to the nucleotide sequence of VGAM32 RNA, herein designated VGAM RNA, also designated SEQ ID:367.

[0620] Another function of VGAM32 is therefore inhibition of LOC254901 (Accession XM_171878). Accordingly, utilities of VGAM32 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254901. LOC257615 (Accession XM_175293) is another VGAM32 host target gene. LOC257615 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC257615, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257615 BINDING SITE, designated SEQ ID:3749, to the nucleotide sequence of VGAM32 RNA, herein designated VGAM RNA, also designated SEQ ID:367.

[0621] Another function of VGAM32 is therefore inhibition of LOC257615 (Accession XM_175293). Accordingly, utilities of VGAM32 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257615. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 33 (VGAM33) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[0622] VGAM33 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM33 was detected is described hereinabove with reference to Figs. 1–8.

[0623] VGAM33 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus. VGAM33 host target gene, herein designated VGAM HOST TARGET

GENE, is a human gene contained in the human genome.

[0624] VGAM33 gene encodes a VGAM33 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM33 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM33 precursor RNA is designated SEQ ID:19, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:19 is located at position 190813 relative to the genome of Vaccinia Virus.

[0625] VGAM33 precursor RNA folds onto itself, forming VGAM33 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[0626] An enzyme complex designated DICER COMPLEX, `dices` the VGAM33 folded precursor RNA into VGAM33 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of VGAM33 RNA is designated SEQ ID:368, and is provided hereinbelow with reference to the sequence listing part.

[0627] VGAM33 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM33 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM33 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[0628] VGAM33 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM33 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM33 RNA is an accurate or a partial inverted-reversed sequence of the nucleotide sequence of

each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM33 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM33 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR and 5' UTR regions.

[0629] The complementary binding of VGAM33 RNA, herein designated VGAM RNA, to host target binding sites on VGAM33 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM33 host target RNA into VGAM33 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[0630] It is appreciated that VGAM33 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM33 host target genes. The mRNA of each one of this plurality of VGAM33 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM33 RNA, herein designated VGAM RNA, and which when bound by VGAM33 RNA causes inhibition of translation of respective one or more VGAM33 host target proteins.

[0631] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM33 gene, herein designated VGAM GENE, on one or more VGAM33 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA

genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[0632] It is yet further appreciated that a function of VGAM33 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM33 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM33 correlate with, and may be deduced from, the identity of the host target genes which VGAM33 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[0633] Nucleotide sequences of the VGAM33 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM33 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM33 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM33 are further described hereinbelow with reference to Table 1.

[0634] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM33 host target RNA, and schematic representation of the complementarity of each of these

host target binding sites to VGAM33 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[0635] As mentioned hereinabove with reference to Fig. 1, a function of VGAM33 gene, herein designated VGAM is inhibition of expression of VGAM33 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM33 correlate with, and may be deduced from, the identity of the target genes which VGAM33 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[0636] Calpain 2, (m/II) Large Subunit (CAPN2, Accession NM_001748) is a VGAM33 host target gene. CAPN2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CAPN2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CAPN2 BINDING SITE, designated SEQ ID:855, to the nucleotide sequence of VGAM33 RNA, herein designated VGAM RNA, also designated SEQ ID:368.

[0637] A function of VGAM33 is therefore inhibition of Calpain 2, (m/II) Large Subunit (CAPN2, Accession NM_001748). Ac-

cordingly, utilities of VGAM33 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CAPN2. Dishevelled Associated Activator of Morphogenesis 2 (DAAM2, Accession XM_166434) is another VGAM33 host target gene. DAAM2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DAAM2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DAAM2 BINDING SITE, designated SEQ ID:3559, to the nucleotide sequence of VGAM33 RNA, herein designated VGAM RNA, also designated SEQ ID:368.

[0638] Another function of VGAM33 is therefore inhibition of Dishevelled Associated Activator of Morphogenesis 2 (DAAM2, Accession XM_166434), a gene which controls cell polarity and movement during development. Accordingly, utilities of VGAM33 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DAAM2. The function of DAAM2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM15. Selectin E (endothelial

adhesion molecule 1) (SELE, Accession NM_000450) is another VGAM33 host target gene. SELE BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SELE, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SELE BINDING SITE, designated SEQ ID:747, to the nucleotide sequence of VGAM33 RNA, herein designated VGAM RNA, also designated SEQ ID:368.

[0639] Another function of VGAM33 is therefore inhibition of Selectin E (endothelial adhesion molecule 1) (SELE, Accession NM_000450), a gene which expressed on cytokine induced endothelial cells and mediates their binding to leukocytes. Accordingly, utilities of VGAM33 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SELE. The function of SELE and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM15. KIAA0475 (Accession NM_014864) is another VGAM33 host target gene. KIAA0475 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded

by KIAA0475, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0475 BINDING SITE, designated SEQ ID:1570, to the nucleotide sequence of VGAM33 RNA, herein designated VGAM RNA, also designated SEQ ID:368.

[0640] Another function of VGAM33 is therefore inhibition of KIAA0475 (Accession NM_014864). Accordingly, utilities of VGAM33 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0475. LOC222671 (Accession XM_167094) is another VGAM33 host target gene. LOC222671 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC222671, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222671 BINDING SITE, designated SEQ ID:3582, to the nucleotide sequence of VGAM33 RNA, herein designated VGAM RNA, also designated SEQ ID:368.

[0641] Another function of VGAM33 is therefore inhibition of LOC222671 (Accession XM_167094). Accordingly, utilities

of VGAM33 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222671. LOC254901 (Accession XM_171878) is another VGAM33 host target gene. LOC254901 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC254901, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254901 BINDING SITE, designated SEQ ID:3699, to the nucleotide sequence of VGAM33 RNA, herein designated VGAM RNA, also designated SEQ ID:368.

[0642] Another function of VGAM33 is therefore inhibition of LOC254901 (Accession XM_171878). Accordingly, utilities of VGAM33 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254901. LOC257615 (Accession XM_175293) is another VGAM33 host target gene. LOC257615 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC257615, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC257615 BINDING SITE, designated SEQ ID:3749, to the nucleotide sequence of VGAM33 RNA, herein designated VGAM RNA, also designated SEQ ID:368.

[0643] Another function of VGAM33 is therefore inhibition of LOC257615 (Accession XM_175293). Accordingly, utilities of VGAM33 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257615. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 34 (VGAM34) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[0644] VGAM34 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM34 was detected is described hereinabove with reference to Figs. 1–8.

[0645] VGAM34 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus. VGAM34 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[0646] VGAM34 gene encodes a VGAM34 precursor RNA, herein

designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM34 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM34 precursor RNA is designated SEQ ID:20, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:20 is located at position 188778 relative to the genome of Vaccinia Virus.

[0647] VGAM34 precursor RNA folds onto itself, forming VGAM34 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[0648] An enzyme complex designated DICER COMPLEX, `dices` the VGAM34 folded precursor RNA into VGAM34 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 90%) nucleotide sequence of VGAM34 RNA is designated SEQ ID:369, and is provided hereinbelow with reference to the sequence listing part.

[0649] VGAM34 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM34 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM34 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[0650] VGAM34 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM34 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM34 RNA is an accurate or a partial inverted-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, desig-

nated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM34 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM34 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR and 5' UTR regions.

[0651] The complementary binding of VGAM34 RNA, herein designated VGAM RNA, to host target binding sites on VGAM34 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM34 host target RNA into VGAM34 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[0652] It is appreciated that VGAM34 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM34 host target genes. The mRNA of

each one of this plurality of VGAM34 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM34 RNA, herein designated VGAM RNA, and which when bound by VGAM34 RNA causes inhibition of translation of respective one or more VGAM34 host target proteins.

[0653] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM34 gene, herein designated VGAM GENE, on one or more VGAM34 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[0654] It is yet further appreciated that a function of VGAM34 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM34 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM34 correlate with, and may be deduced from, the identity of the host target genes which VGAM34 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[0655] Nucleotide sequences of the VGAM34 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM34 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM34 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM34 are further described hereinbelow with reference to Table 1.

[0656] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM34 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM34 RNA, herein designated VGAM RNA, are described hereinbelow with refer-

ence to Table 2.

[0657] As mentioned hereinabove with reference to Fig. 1, a function of VGAM34 gene, herein designated VGAM is inhibition of expression of VGAM34 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM34 correlate with, and may be deduced from, the identity of the target genes which VGAM34 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[0658] Adenylate Cyclase 6 (ADCY6, Accession NM_015270) is a VGAM34 host target gene. ADCY6 BINDING SITE1 and ADCY6 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by ADCY6, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ADCY6 BINDING SITE1 and ADCY6 BINDING SITE2, designated SEQ ID:1617 and SEQ ID:1933 respectively, to the nucleotide sequence of VGAM34 RNA, herein designated VGAM RNA, also designated SEQ ID:369.

[0659] A function of VGAM34 is therefore inhibition of Adenylate Cyclase 6 (ADCY6, Accession NM_015270), a gene which this a membrane-bound, Ca^{2+} -inhibitable adenylyl cy-

class (by similarity). Accordingly, utilities of VGAM34 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADCY6. The function of ADCY6 has been established by previous studies. By Southern blot analysis of somatic cell hybrid DNAs, Gaudin et al. (1994) mapped the ADCY6 gene to chromosome 12. Using isotopic in situ hybridization, Haber et al. (1994) mapped the ADCY6 gene to 12q12-q13. By fluorescence in situ hybridization, Edelhoff et al. (1995) confirmed the assignment of ADCY6 to 12q13 and demonstrated that the homologous mouse gene is located on chromosome 15 in the F region.

[0660] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[0661] Edelhoff, S.; Villacres, E. C.; Storm, D. R.; Disteche, C. M. : Mapping of adenylyl cyclase genes type I, II, III, IV, V, and VI in mouse. *Mammalian Genome* 6: 111-113, 1995. ; and

[0662] Gaudin, C.; Homcy, C. J.; Ishikawa, Y. : Mammalian adenylyl cyclase family members are randomly located on different chromosomes. *Hum. Genet.* 94: 527-529, 1994.

[0663] Further studies establishing the function and utilities of ADCY6 are found in John Hopkins OMIM database record

ID 600294, and in cited publications numbered 85–8 and 2305 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. ATPase, Class I, Type 8B, Member 2 (ATP8B2, Accession XM_036933) is another VGAM34 host target gene. ATP8B2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ATP8B2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATP8B2 BINDING SITE, designated SEQ ID:2716, to the nucleotide sequence of VGAM34 RNA, herein designated VGAM RNA, also designated SEQ ID:369.

[0664] Another function of VGAM34 is therefore inhibition of ATPase, Class I, Type 8B, Member 2 (ATP8B2, Accession XM_036933). Accordingly, utilities of VGAM34 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP8B2. Carcinoembryonic Antigen-related Cell Adhesion Molecule 1 (biliary glycoprotein) (CEACAM1, Accession NM_001712) is another VGAM34 host target gene. CEACAM1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CEACAM1, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CEACAM1 BINDING SITE, designated SEQ ID:848, to the nucleotide sequence of VGAM34 RNA, herein designated VGAM RNA, also designated SEQ ID:369.

[0665] Another function of VGAM34 is therefore inhibition of Carcinoembryonic Antigen-related Cell Adhesion Molecule 1 (biliary glycoprotein) (CEACAM1, Accession NM_001712), a gene which is a major effector of VEGF and may be a target for the inhibition of tumor angiogenesis. Accordingly, utilities of VGAM34 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CEACAM1. The function of CEACAM1 has been established by previous studies. Ergun et al. (2000) showed that CEACAM1 exhibits angiogenic properties in in vitro and in vivo angiogenesis assays. CEACAM1 purified from granulocytes and endothelial cell media as well as recombinant CEACAM1 expressed in HEK293 cells stimulated proliferation, chemotaxis, and capillary-like tube formation of human microvascular endothelial cells. They increased vascularization of chick chorioallantoic membrane and potentiated the effects of VEGF165 (OMIM

Ref. No. 192240). VEGF165 increased CEACAM1 expression at both the mRNA and the protein level.

VEGF165-induced endothelial tube formation was blocked by a monoclonal CEACAM1 antibody. These data suggested that CEACAM1 is a major effector of VEGF in the early microvessel formation. Since CEACAM1 is expressed in tumor microvessels but not in large blood vessels, CEACAM1 may be a target for the inhibition of tumor angiogenesis. Following infection with *Neisseria gonorrhoea*, there is a transient decline in circulating CD4 (OMIM Ref. No. 186940)-positive T lymphocytes that resolves after bacterial clearance. The gonococcus adheres to and is taken up by host cells through opacity-associated (Opa) proteins. Some Opa variants bind to heparan sulfate proteoglycans (HSPGs, e.g., SDC2; 142460), while others are specific for members of the CEACAM1/CD66 receptor family. CEACAM1 is the only member of this family that is expressed by lymphocytes and that contains a cytoplasmic ITIM (immunoreceptor tyrosine-based inhibitory motif). Using flow cytometry, Boulton and Gray-Owen (2002) demonstrated that CEACAM1 expression is upregulated after lymphocyte activation. Exposure to gonococci expressing the HSPG-specific Opa50 protein increased and

exposure to CEACAM1-specific Opa52 gonococci or to anti-CEACAM1 antibody inhibited expression of the CD69 (OMIM Ref. No. 107273) activation marker on and proliferation by lymphocytes stimulated in vitro. The reduction in lymphocyte proliferation was not due to an increase in cell death. CEACAM1 associated with Opa52 also interacted with SHP1 (OMIM Ref. No. 176883) and SHP2 (OMIM Ref. No. 176876), presumably through its cytoplasmic ITIM. Boulton and Gray-Owen (2002) suggested that Opa52 engagement of the CEACAM1 coinhibitory receptor induces immunosuppression and may explain the failure of the host to develop a memory humoral response to N. gonorrhea infection due to a lack of T-cell help for B-cell activation. Animal model experiments lend further support to the function of CEACAM1. Poy et al. (2002) hypothesized that insulin stimulates phosphorylation of CEACAM1 which in turn leads to upregulation of receptor-mediated insulin endocytosis and degradation in the hepatocyte. To test the hypothesis, they generated transgenic mice overexpressing in liver a dominant-negative phosphorylation-defective CEACAM1 mutant, S503A. Supporting their hypothesis, they found that S503A-CEACAM1 transgenic mice developed hyperinsulinemia resulting

from impaired insulin clearance. The hyperinsulinemia caused secondary insulin resistance with impaired glucose tolerance and random, but not fasting, hyperglycemia. Transgenic mice developed visceral adiposity with increased amounts of plasma free fatty acids and plasma and hepatic triglycerides. These findings suggested a mechanism through which insulin signaling regulates insulin sensitivity by modulating hepatic insulin clearance.

[0666] It is appreciated that the abovementioned animal model for CEACAM1 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[0667] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[0669] Boulton, I. C.; Gray-Owen, S. D. : Neisserial binding to CEACAM1 arrests the activation and proliferation of CD4+

T lymphocytes. Nature Immun. 3: 229–236, 2002.

[0670] Further studies establishing the function and utilities of CEACAM1 are found in John Hopkins OMIM database record ID 109770, and in cited publications numbered 2820, 2821, 2822–2824, 2467, 2825–2826, 47, 2464–2465, 2468, 282 and 2469 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Carbohydrate (keratan sulfate Gal–6) Sulfotransferase 1 (CHST1, Accession NM_003654) is another VGAM34 host target gene. CHST1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CHST1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CHST1 BINDING SITE, designated SEQ ID:1046, to the nucleotide sequence of VGAM34 RNA, herein designated VGAM RNA, also designated SEQ ID:369.

[0671] Another function of VGAM34 is therefore inhibition of Carbohydrate (keratan sulfate Gal–6) Sulfotransferase 1 (CHST1, Accession NM_003654), a gene which may play a role in keratan sulfate biosynthesis in brain and cornea. Accordingly, utilities of VGAM34 include diagnosis, pre-

vention and treatment of diseases and clinical conditions associated with CHST1. The function of CHST1 has been established by previous studies. The keratan sulfate proteoglycans lumican and keratocan are the major proteoglycans in the cornea and are thought to play an important role in corneal transparency. Sulfation appears to be important for the biologic function of keratan sulfate, because undersulfated keratan sulfate is synthesized in patients with macular corneal dystrophy (see OMIM Ref. No. 217800). Keratan sulfate bears sulfate groups on both N-acetylglucosamine (OMIM Ref. No. GlcNAc) and galactose residues. Fukuta et al. (1997) stated that C6ST (chondroitin 6-sulfotransferase; 603799) catalyzes sulfation of chondroitin and keratan sulfate. However, in developing cornea, keratan sulfate is actively synthesized while chondroitin 6-sulfate synthesis is minimal, suggesting that a different sulfotransferase is present in cornea with specificity towards keratan sulfate. By screening a human fetal brain library with a chick C6ST cDNA, Fukuta et al. (1997) isolated cDNAs encoding C6ST and keratan sulfate gal-6-sulfotransferase (KSGal6ST). Northern blot analysis revealed that the 2.8-kb KSGal6ST mRNA was expressed in human brain and in chick brain and cornea. A

slightly larger and less abundant transcript was observed in human skeletal muscle. The predicted 411-amino acid KSGal6ST shares 37% sequence identity with chick C6ST. When the KSGal6ST cDNA was expressed in COS-7 cells, keratan sulfate sulfotransferase activity increased, but C6ST activity did not. In vitro, the partially purified KS-Gal6ST protein showed substrate specificity towards keratan sulfate; KSGal6ST could not utilize chondroitin as an acceptor. Fukuta et al. (1997) concluded that KSGal6ST may participate in the biosynthesis of keratan sulfate in the brain and cornea. Independently, Mazany et al. (1998) cloned genomic DNA and cDNAs corresponding to CHST1, which they called C6ST. These authors found that stable expression of the CHST1 cDNA in CHO cells increased both C6ST and keratan sulfate sulfotransferase activities. Mazany et al. (1998) suggested that the distinct pattern of CHST1 enzyme activity observed by Fukuta et al. (1997) may be due to differences between the mammalian cell lines used by the 2 groups to express the enzyme.

[0672] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[0673] Iida, A.; Saito, S.; Sekine, A.; Mishima, C.; Kitamura, Y.;

Kondo, K.; Harigae, S.; Osawa, S.; Nakamura, Y. : Catalog of 77 single-nucleotide polymorphisms (SNPs) in the carbohydrate sulfotransferase 1 (CHST1) and carbohydrate sulfotransferase 3 (CHST3) genes. J. Hum. Genet. 47: 14–19, 2002. ; and

[0674] Mazany, K. D.; Peng, T.; Watson, C. E.; Tabas, I.; Williams, K. J. : Human chondroitin 6-sulfotransferase: cloning, gene structure, and chromosomal localization. Biochim. Biophys. Acta.

[0675] Further studies establishing the function and utilities of CHST1 are found in John Hopkins OMIM database record ID 603797, and in cited publications numbered 222–224 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. F-box and Leucine-rich Repeat Protein 7 (FBXL7, Accession NM_012304) is another VGAM34 host target gene. FBXL7 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FBXL7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FBXL7 BINDING SITE, designated SEQ ID:1425, to the nucleotide sequence of VGAM34 RNA, herein designated VGAM RNA,

also designated SEQ ID:369.

[0676] Another function of VGAM34 is therefore inhibition of F-box and Leucine-rich Repeat Protein 7 (FBXL7, Accession NM_012304), a gene which may be involved in in phosphorylation-dependent ubiquitination. Accordingly, utilities of VGAM34 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FBXL7. The function of FBXL7 has been established by previous studies. The F box, named after cyclin F (CCNF; 600227), in which it was originally observed, is an approximately 40-amino acid motif that binds SKP1 (OMIM Ref. No. 601434). F-box proteins are components of modular E3 ubiquitin protein ligases called SCFs (SKP1, OMIM Ref. No. 603134), F-box proteins), which function in phosphorylation-dependent ubiquitination. Using a yeast 2-hybrid screen with SKP1 as bait, followed by searching sequence databases, Winston et al. (1999) and Cenciarelli et al. (1999) identified 33 mammalian and 26 human F-box proteins, respectively. These contained C termini with leucine-rich repeats (FBXLs, e.g., SKP2 (OMIM Ref. No. 601436)), WD40 domains (FBXWs, e.g., BTRCP (OMIM Ref. No. 603482)), or no recognizable motifs (FBXOs, e.g., CCNF). Winston et al. (1999) predicted the

presence of 12 leucine-rich repeats (LRRs) in FBXL7. RT-PCR analysis detected strong expression in all tissues tested, with highest levels in heart, kidney, liver, and lung.

[0677] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[0678] Nagase, T.; Ishikawa, K.; Suyama, M.; Kikuno, R.; Hiro-sawa, M.; Miyajima, N.; Tanaka, A.; Kotani, H.; Nomura, N.; Ohara, O. : Prediction of the coding sequences of unidentified human genes. XII. The complete sequences of 100 new cDNA clones from brain which code for large proteins in vitro. DNA Res. 5: 355-364, 1998. ; and

[0679] Winston, J. T.; Koepp, D. M.; Zhu, C.; Elledge, S. J.; Harper, J. W. : A family of mammalian F-box proteins. Curr. Biol. 9: 1180-1182, 1999.

[0680] Further studies establishing the function and utilities of FBXL7 are found in John Hopkins OMIM database record ID 605656, and in cited publications numbered 7 and 1882 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Homeo Box C9 (HOXC9, Accession XM_028620) is another VGAM34 host target gene. HOXC9 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA en-

coded by HOXC9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HOXC9 BINDING SITE, designated SEQ ID:2592, to the nucleotide sequence of VGAM34 RNA, herein designated VGAM RNA, also designated SEQ ID:369.

[0681] Another function of VGAM34 is therefore inhibition of Homeo Box C9 (HOXC9, Accession XM_028620). Accordingly, utilities of VGAM34 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HOXC9. Insulin-like Growth Factor 1 (somatomedin C) (IGF1, Accession NM_000618) is another VGAM34 host target gene. IGF1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by IGF1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IGF1 BINDING SITE, designated SEQ ID:763, to the nucleotide sequence of VGAM34 RNA, herein designated VGAM RNA, also designated SEQ ID:369.

[0682] Another function of VGAM34 is therefore inhibition of In-

ulin-like Growth Factor 1 (somatomedin C) (IGF1, Accession NM_000618), a gene which are structurally and functionally related to insulin but have a much higher growth-promoting activity. Accordingly, utilities of VGAM34 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IGF1. The function of IGF1 has been established by previous studies. By the solid-phase method, Li et al. (1983) synthesized human somatomedin C, which has 70 amino acid residues and 3 disulfide bridges. Using cDNA probes in the analysis of somatic cell hybrids, Brissenden et al. (1984) and Tricoli et al. (1984) independently assigned the IGF1 structural gene to chromosome 12. Tricoli et al. (1984) regionalized the locus tentatively to 12q22-qter, where the KRAS2 (OMIM Ref. No. 190070) gene is situated. This proximity, as well as that of the HRAS1 (OMIM Ref. No. 190020) and IGF2 (OMIM Ref. No. 147470) genes on 11p and that of the NRAS (OMIM Ref. No. 164790) and NGFB (OMIM Ref. No. 162030) genes in band 1p22, suggested to Brissenden et al. (1984) that a functional or evolutionary relationship may exist between members of the RAS family of protooncogenes and growth factor genes. Chromosomal abnormalities in the region of these genes have been associ-

ated with specific forms of neoplasia. Both IGF1 and IGF2 have a striking structural homology to proinsulin. Deficiency of IGF1 was proposed as the nature of the basic defect in the African pygmy (OMIM Ref. No. 265850) and possibly also in the Laron type of dwarfism (OMIM Ref. No. 262500). The homology of chromosomes 11 and 12 is supported by the finding of yet another pair of structurally homologous loci on these 2 chromosomes. See 146000 for description of the work of Mullis et al. (1991) suggesting that the IGF1 gene may be the site of the mutation causing one form of hypochondroplasia. Using stored sera from men followed in the Baltimore Longitudinal Study on Aging, Harman et al. (2000) investigated whether the circulating IGF1 level is an independent predictor of prostate cancer and compared its predictive value with those of IGF2, IGFBP3, and prostate-specific antigen (PSA; 176820). High IGF1 and low IGF2 were independently associated with increased risk for prostate cancer, but PSA level was a much stronger predictor of prostate cancer than either IGF1 or IGF2. The absence of a relationship of IGF1 to prostate size is inconsistent with increased ascertainment in men with large prostates as the source of greater prostate cancer risk associated with IGF1. The au-

thors concluded that IGF2 may inhibit both prostate growth and development of prostate cancer. Low birthweight is associated with later risk of type 2 diabetes and related disorders. Vaessen et al. (2002) studied the relationship between low birthweight and a polymorphism in the IGF1 gene that raises risk of type 2 diabetes and myocardial infarction. They recorded birthweight and obtained DNA for 463 adults. Individuals who did not have the wildtype allele of the polymorphism had a 215-gram lower birthweight than those homozygous for the wildtype allele. The data lent support to the hypothesis that genetic variation affecting fetal growth could account for the association between low birthweight and susceptibility to diabetes and cardiovascular disease in later life. Postnatal growth and development are coordinated by genetic and environmental influences and numerous growth factors. Le Roith et al. (2001) reviewed the essential role that the GH-IGF1 axis plays in these processes. Although the GH-IGF1 axis is a closely coordinated system, both GH and IGF1 have independent actions, many of which have become apparent more recently following the characterization of clinical syndromes and the development of mouse models. Genetic manipulation of mice has enabled investiga-

tors to reexamine many of the established hypotheses regarding the GH-IGFI axis. Results gleaned from a mouse model created by tissue-specific gene deletion of liver IGFI (Yakar et. al, 1999; Sjogren et al., 1999) enabled investigators to reevaluate the original 'somatomedin hypothesis.' Animal model experiments lend further support to the function of IGF1. Aging skeletal muscles suffer a steady decline in mass and functional performance, and compromised muscle integrity as fibrotic invasions replace contractile tissue. The same programmed deficits in muscle structure and function are found in numerous neurodegenerative syndromes and disease-related cachexia. Musaro et al. (2001) generated a model of persistent, functional myocyte hypertrophy using a tissue-restricted transgene encoding a locally acting isoform of Igf1 that is expressed in skeletal muscle. Transgenic embryos developed normally, and postnatal increases in muscle mass and strength were not accompanied by the additional pathologic changes seen in other Igf1 transgenic models. Expression of Gata2 (OMIM Ref. No. 137295), a transcription factor normally undetected in skeletal muscle, marked hypertrophic myocytes that escaped age-related muscle atrophy and retained the prolifer-

erative response to muscle injury characteristic of younger animals. The observations were thought to suggest usefulness of localized expression of this transgene as a clinical strategy for the treatment of age- or disease-related muscle frailty.

[0683] It is appreciated that the abovementioned animal model for IGF1 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[0684] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[0685] Musaro, A.; McCullagh, K.; Paul, A.; Houghton, L.; Dobrowolny, G.; Molinaro, M.; Barton, E. R.; Sweeney, H. L.; Rosenthal, N. : Localized Igf-1 transgene expression sustains hypertrophy and regeneration in senescent skeletal muscle. *Nature Genet.* 27: 195-200, 2001. ; and

[0686] Le Roith, D.; Scavo, L.; Butler, A. : What is the role of circulating IGF-I? *Trends Endocr. Metab.* 12: 48-52, 2001.

[0687] Further studies establishing the function and utilities of IGF1 are found in John Hopkins OMIM database record ID 147440, and in cited publications numbered 2670-2672, 1047-1048, 2673-2675, 2688, 2694, 2698-2696, 695,

2697, 2699–2700, 329, 2701–2703, 1049, 2704–2708, 2582, 2709–2716, 858–860, and 885–889 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Integrin, Alpha L (antigen CD11A (p180), Lymphocyte Function–associated Antigen 1; Alpha Polypeptide) (ITGAL, Accession NM_002209) is another VGAM34 host target gene. ITGAL BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ITGAL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ITGAL BINDING SITE, designated SEQ ID:907, to the nucleotide sequence of VGAM34 RNA, herein designated VGAM RNA, also designated SEQ ID:369.

[0688] Another function of VGAM34 is therefore inhibition of Integrin, Alpha L (antigen CD11A (p180), Lymphocyte Function–associated Antigen 1; Alpha Polypeptide) (ITGAL, Accession NM_002209), a gene which is a receptor for icam1, icam2, icam3 and icam4. It is involved in a variety of immune phenomena including leukocyte–endothelial cell interaction, cytotoxic t-cell mediated killing, and antibody dependent killing by granulocytes and monocytes. Ac-

cordingly, utilities of VGAM34 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ITGAL. The function of ITGAL has been established by previous studies. See 120980 and 151510. Lymphocyte function-associated antigen-1 (LFA-1) shares a beta subunit (see OMIM Ref. No. 116920) with other members of a family of leukocyte surface membrane antigens but has a unique alpha subunit (Sanchez-Madrid et al., 1983). LFA-1 is expressed on lymphocytes and phagocytic cells. The LFA-1 molecule is involved in the adhesion of cytotoxic T cells to their target cells. Patients with LFA-1 immunodeficiency disease (see OMIM Ref. No. 116920) have recurrent life-threatening infections, show deficiency of the beta chain of all 3 molecules, LFA-1, Mac-1 (macrophage antigen-1), and p150,95, and display profound defects in adhesion-dependent granulocyte, monocyte, and B- and T-lymphocyte functions. The alpha subunits were designated by Marlin et al. (1986) as alpha-L for LFA-1, alpha-M for Mac-1, and alpha-X for p150,95. Lu and Cyster (2002) studied the mechanisms that control localization of marginal zone B cells. They demonstrated that marginal zone B cells express elevated levels of the integrins LFA-1 and alpha-4-beta-1 (see OMIM Ref. No.

192975 and 135630) and that the marginal zone B cells bind to the ligands ICAM1 (OMIM Ref. No. 147840) and VCAM1 (OMIM Ref. No. 192225). These ligands are expressed within the marginal zone in a lymphotoxin-dependent manner. Combined inhibition of LFA-1 and alpha-4-beta-1 causes a rapid and selective release of B cells from the marginal zone. Furthermore, lipopolysaccharide-triggered marginal zone B cell relocalization involves down-regulation of integrin-mediated adhesion. Lu and Cyster (2002) concluded that their studies identified key requirements for marginal zone B cell localization and established a role for integrins in peripheral lymphoid tissue compartmentalization

[0689] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[0692] Further studies establishing the function and utilities of ITGAL are found in John Hopkins OMIM database record ID 153370, and in cited publications numbered 1120–1121, 684, 77 and 835–836 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Lamin B Receptor (LBR, Accession XM_001795) is another VGAM34 host target gene. LBR BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LBR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LBR BINDING SITE, designated SEQ ID:2522, to the nucleotide sequence of VGAM34 RNA, herein designated VGAM RNA, also designated SEQ ID:369.

[0693] Another function of VGAM34 is therefore inhibition of Lamin B Receptor (LBR, Accession XM_001795). Accordingly, utilities of VGAM34 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LBR. Major Intrinsic Protein of Lens Fiber (MIP, Accession NM_012064) is another VGAM34 host target gene. MIP BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by

MIP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MIP BINDING SITE, designated SEQ ID:1399, to the nucleotide sequence of VGAM34 RNA, herein designated VGAM RNA, also designated SEQ ID:369.

[0694] Another function of VGAM34 is therefore inhibition of Major Intrinsic Protein of Lens Fiber (MIP, Accession NM_012064). Accordingly, utilities of VGAM34 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MIP. Relaxin 2 (H2) (RLN2, Accession NM_005059) is another VGAM34 host target gene. RLN2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RLN2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RLN2 BINDING SITE, designated SEQ ID:1175, to the nucleotide sequence of VGAM34 RNA, herein designated VGAM RNA, also designated SEQ ID:369.

[0695] Another function of VGAM34 is therefore inhibition of Relaxin 2 (H2) (RLN2, Accession NM_005059). Accordingly, utilities of VGAM34 include diagnosis, prevention and

treatment of diseases and clinical conditions associated with RLN2. SART2 (Accession NM_013352) is another VGAM34 host target gene. SART2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SART2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SART2 BINDING SITE, designated SEQ ID:1444, to the nucleotide sequence of VGAM34 RNA, herein designated VGAM RNA, also designated SEQ ID:369.

[0696] Another function of VGAM34 is therefore inhibition of SART2 (Accession NM_013352). Accordingly, utilities of VGAM34 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SART2. Thiamin Pyrophosphokinase 1 (TPK1, Accession NM_022445) is another VGAM34 host target gene. TPK1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TPK1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TPK1 BINDING SITE, designated SEQ ID:1987, to the nu-

cleotide sequence of VGAM34 RNA, herein designated VGAM RNA, also designated SEQ ID:369.

[0697] Another function of VGAM34 is therefore inhibition of Thiamin Pyrophosphokinase 1 (TPK1, Accession NM_022445), a gene which catalyzes the conversion of thiamine, a form of vitamin B1, to thiamine pyrophosphate . Accordingly, utilities of VGAM34 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TPK1. The function of TPK1 has been established by previous studies. By Northern blot analysis, Nosaka et al. (1999) detected expression of mouse Tpk1 predominantly in kidney and liver, with very faint expression in heart, brain, and testis. In contrast to the tissue-specific expression of mouse Tpk1, Nosaka et al. (2001) reported broad expression of a human 2.5-kb TPK1 transcript. They detected very low expression in a variety of human tissues and relatively abundant expression in heart, kidney, and peripheral leukocytes. By Northern blot analysis, Zhao et al. (2001) detected broad expression of a 2.6-kb TPK1 transcript, with highest levels in testis and in those tissues involved in thiamine absorption (small intestine) and reabsorption (OMIM Ref. No. kidney). They also detected a smaller (1–1.5 kb), testis-specific TPK1 tran-

script. From results of cell culture experiments, Nosaka et al. (1999) and Nosaka et al. (2001) concluded that thiamine or a thiamine derivative does not participate in the regulation of TPK1. Nosaka et al. (2001) detected no difference in TPK1 expression in cultured fibroblasts from normal subjects or from patients with thiamine-responsive megaloblastic anemia (OMIM Ref. No. 249270).

[0698] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[0699] Zhao, R.; Gao, F.; Goldman, I. D. : Molecular cloning of human thiamin pyrophosphokinase. *Biochim. Biophys. Acta* 1517: 320–322, 2001. ; and

[0700] Nosaka, K.; Onozuka, M.; Nishino, H.; Nishimura, H.; Kawasaki, Y.; Ueyama, H. : Molecular cloning and expression of a mouse thiamin pyrophosphokinase cDNA. *J. Biol. Chem.* 274: 34129–3413.

[0701] Further studies establishing the function and utilities of TPK1 are found in John Hopkins OMIM database record ID 606370, and in cited publications numbered 1437–1439 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Thyroid Hormone Receptor Interactor 12 (TRIP12, Accession NM_004238) is

another VGAM34 host target gene. TRIP12 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TRIP12, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRIP12 BINDING SITE, designated SEQ ID:1094, to the nucleotide sequence of VGAM34 RNA, herein designated VGAM RNA, also designated SEQ ID:369.

[0702] Another function of VGAM34 is therefore inhibition of Thyroid Hormone Receptor Interactor 12 (TRIP12, Accession NM_004238), a gene which interacts with the ligand binding domain of the thyroid hormone receptor (in a thyroid hormone t3-independent manner) and with retinoid x receptor (rxr). Accordingly, utilities of VGAM34 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRIP12. The function of TRIP12 has been established by previous studies. By sequencing cDNAs randomly selected from a cDNA library derived from a human immature myeloid cell line, Nomura et al. (1994) isolated a cDNA encoding TRIP12, which they called KIAA0045. The predicted 1,992-amino acid TRIP12 protein contains a putative transmembrane domain.

TRIP12 shares amino acid sequence similarity with the *S. cerevisiae* YKL010C gene product in 3 regions, with percent identities ranging from approximately 33 to 43%. Northern blot analysis detected TRIP12 expression in all 16 human tissues examined, with the highest expression in skeletal muscle and testis, lower expression in heart, kidney, spleen, thymus, prostate, ovary, placenta, and peripheral blood leukocytes, and the lowest expression in brain, lung, liver, pancreas, small intestine, and colon. The thyroid hormone receptors (TRs) are hormone-dependent transcription factors that regulate expression of a variety of specific target genes. They must specifically interact with a number of proteins as they progress from their initial translation and nuclear translocation to heterodimerization with retinoid X receptors (RXRs), functional interactions with other transcription factors and the basic transcriptional apparatus, and eventually, degradation. To help elucidate the mechanisms that underlie the transcriptional effects and other potential functions of TRs, Lee et al. (1995) used the yeast interaction trap, a version of the yeast 2-hybrid system, to identify proteins that specifically interact with the ligand-binding domain of rat TR-beta (THRB; 190160). They isolated HeLa cell cDNAs

encoding several different TR-interacting proteins (TRIPs), including TRIP12. TRIP12 interacted with rat Thrb only in the absence of thyroid hormone. It did not interact with RXR-alpha (RXRA; 180245) or the glucocorticoid receptor (NR3C1; 138040) under any condition. TRIP12 shares sequence similarity with E6AP (UBE3A; 601623), a ubiquitin-protein ligase.

[0703] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[0704] Lee, J. W.; Choi, H.-S.; Gyuris, J.; Brent, R.; Moore, D. D. : Two classes of proteins dependent on either the presence or absence of thyroid hormone for interaction with the thyroid hormone receptor. *Molec. Endocr.* 9: 243-254, 1995. ; and

[0705] Nomura, N.; Nagase, T.; Miyajima, N.; Sazuka, T.; Tanaka, A.; Sato, S.; Seki, N.; Kawarabayashi, Y.; Ishikawa, K.; Tabata, S. : Prediction of the coding sequences of unidentified human g.

[0706] Further studies establishing the function and utilities of TRIP12 are found in John Hopkins OMIM database record ID 604506, and in cited publications numbered 1444 listed in the bibliography section hereinbelow, which are

also hereby incorporated by reference. Bromodomain Containing 3 (BRD3, Accession NM_007371) is another VGAM34 host target gene. BRD3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BRD3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BRD3 BINDING SITE, designated SEQ ID:1398, to the nucleotide sequence of VGAM34 RNA, herein designated VGAM RNA, also designated SEQ ID:369.

[0707] Another function of VGAM34 is therefore inhibition of Bromodomain Containing 3 (BRD3, Accession NM_007371). Accordingly, utilities of VGAM34 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BRD3. FLJ13397 (Accession NM_024948) is another VGAM34 host target gene. FLJ13397 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ13397, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13397 BINDING SITE, designated SEQ

ID:2116, to the nucleotide sequence of VGAM34 RNA, herein designated VGAM RNA, also designated SEQ ID:369.

[0708] Another function of VGAM34 is therefore inhibition of FLJ13397 (Accession NM_024948). Accordingly, utilities of VGAM34 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13397. FLJ22202 (Accession NM_024883) is another VGAM34 host target gene. FLJ22202 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ22202, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22202 BINDING SITE, designated SEQ ID:2103, to the nucleotide sequence of VGAM34 RNA, herein designated VGAM RNA, also designated SEQ ID:369.

[0709] Another function of VGAM34 is therefore inhibition of FLJ22202 (Accession NM_024883). Accordingly, utilities of VGAM34 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22202. GROS1 (Accession NM_022356) is another VGAM34 host target gene. GROS1 BINDING SITE is HOST TARGET binding

site found in the 3' untranslated region of mRNA encoded by GROS1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GROS1 BINDING SITE, designated SEQ ID:1986, to the nucleotide sequence of VGAM34 RNA, herein designated VGAM RNA, also designated SEQ ID:369.

[0710] Another function of VGAM34 is therefore inhibition of GROS1 (Accession NM_022356). Accordingly, utilities of VGAM34 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GROS1. KIAA0981 (Accession XM_028867) is another VGAM34 host target gene. KIAA0981 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0981, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0981 BINDING SITE, designated SEQ ID:2598, to the nucleotide sequence of VGAM34 RNA, herein designated VGAM RNA, also designated SEQ ID:369.

[0711] Another function of VGAM34 is therefore inhibition of

KIAA0981 (Accession XM_028867). Accordingly, utilities of VGAM34 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0981. KIAA1243 (Accession XM_057057) is another VGAM34 host target gene. KIAA1243 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1243, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1243 BINDING SITE, designated SEQ ID:2978, to the nucleotide sequence of VGAM34 RNA, herein designated VGAM RNA, also designated SEQ ID:369.

[0712] Another function of VGAM34 is therefore inhibition of KIAA1243 (Accession XM_057057). Accordingly, utilities of VGAM34 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1243. KIAA1462 (Accession XM_166132) is another VGAM34 host target gene. KIAA1462 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1462, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of KIAA1462 BINDING SITE, designated SEQ ID:3524, to the nucleotide sequence of VGAM34 RNA, herein designated VGAM RNA, also designated SEQ ID:369.

[0713] Another function of VGAM34 is therefore inhibition of KIAA1462 (Accession XM_166132). Accordingly, utilities of VGAM34 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1462. MGC1136 (Accession NM_024025) is another VGAM34 host target gene. MGC1136 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC1136, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC1136 BINDING SITE, designated SEQ ID:2041, to the nucleotide sequence of VGAM34 RNA, herein designated VGAM RNA, also designated SEQ ID:369.

[0714] Another function of VGAM34 is therefore inhibition of MGC1136 (Accession NM_024025). Accordingly, utilities of VGAM34 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC1136. MSTP043 (Accession NM_031953) is another

VGAM34 host target gene. MSTP043 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MSTP043, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MSTP043 BINDING SITE, designated SEQ ID:2223, to the nucleotide sequence of VGAM34 RNA, herein designated VGAM RNA, also designated SEQ ID:369.

[0715] Another function of VGAM34 is therefore inhibition of MSTP043 (Accession NM_031953). Accordingly, utilities of VGAM34 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MSTP043. Nup43 (Accession NM_024647) is another VGAM34 host target gene. Nup43 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by Nup43, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of Nup43 BINDING SITE, designated SEQ ID:2075, to the nucleotide sequence of VGAM34 RNA, herein designated VGAM RNA, also designated SEQ ID:369.

[0716] Another function of VGAM34 is therefore inhibition of Nup43 (Accession NM_024647). Accordingly, utilities of VGAM34 include diagnosis, prevention and treatment of diseases and clinical conditions associated with Nup43. Ribosomal Protein S6 Kinase, 90kDa, Polypeptide 4 (RPS6KA4, Accession NM_003942) is another VGAM34 host target gene. RPS6KA4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RPS6KA4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RPS6KA4 BINDING SITE, designated SEQ ID:1072, to the nucleotide sequence of VGAM34 RNA, herein designated VGAM RNA, also designated SEQ ID:369.

[0717] Another function of VGAM34 is therefore inhibition of Ribosomal Protein S6 Kinase, 90kDa, Polypeptide 4 (RPS6KA4, Accession NM_003942). Accordingly, utilities of VGAM34 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RPS6KA4. Solute Carrier Family 17 (sodium-dependent inorganic phosphate cotransporter), Member 6 (SLC17A6, Accession NM_020346) is another VGAM34 host target gene.

SLC17A6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC17A6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC17A6 BINDING SITE, designated SEQ ID:1911, to the nucleotide sequence of VGAM34 RNA, herein designated VGAM RNA, also designated SEQ ID:369.

[0718] Another function of VGAM34 is therefore inhibition of Solute Carrier Family 17 (sodium-dependent inorganic phosphate cotransporter), Member 6 (SLC17A6, Accession NM_020346). Accordingly, utilities of VGAM34 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC17A6. TERA (Accession NM_021238) is another VGAM34 host target gene. TERA BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TERA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TERA BINDING SITE, designated SEQ ID:1949, to the nucleotide sequence of VGAM34 RNA, herein designated

VGAM RNA, also designated SEQ ID:369.

[0719] Another function of VGAM34 is therefore inhibition of TERA (Accession NM_021238). Accordingly, utilities of VGAM34 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TERA. Vav 3 Oncogene (VAV3, Accession NM_006113) is another VGAM34 host target gene. VAV3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by VAV3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of VAV3 BINDING SITE, designated SEQ ID:1273, to the nucleotide sequence of VGAM34 RNA, herein designated VGAM RNA, also designated SEQ ID:369.

[0720] Another function of VGAM34 is therefore inhibition of Vav 3 Oncogene (VAV3, Accession NM_006113). Accordingly, utilities of VGAM34 include diagnosis, prevention and treatment of diseases and clinical conditions associated with VAV3. LOC120892 (Accession XM_058513) is another VGAM34 host target gene. LOC120892 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC120892, corresponding

to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC120892 BINDING SITE, designated SEQ ID:2987, to the nucleotide sequence of VGAM34 RNA, herein designated VGAM RNA, also designated SEQ ID:369.

[0721] Another function of VGAM34 is therefore inhibition of LOC120892 (Accession XM_058513). Accordingly, utilities of VGAM34 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC120892. LOC155434 (Accession XM_098723) is another VGAM34 host target gene. LOC155434 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC155434, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC155434 BINDING SITE, designated SEQ ID:3376, to the nucleotide sequence of VGAM34 RNA, herein designated VGAM RNA, also designated SEQ ID:369.

[0722] Another function of VGAM34 is therefore inhibition of LOC155434 (Accession XM_098723). Accordingly, utilities of VGAM34 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LOC155434. LOC169966 (Accession XM_093010) is another VGAM34 host target gene. LOC169966 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC169966, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC169966 BINDING SITE, designated SEQ ID:3252, to the nucleotide sequence of VGAM34 RNA, herein designated VGAM RNA, also designated SEQ ID:369.

[0723] Another function of VGAM34 is therefore inhibition of LOC169966 (Accession XM_093010). Accordingly, utilities of VGAM34 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC169966. LOC221272 (Accession XM_168050) is another VGAM34 host target gene. LOC221272 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC221272, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221272 BINDING SITE, designated SEQ ID:3616, to

the nucleotide sequence of VGAM34 RNA, herein designated VGAM RNA, also designated SEQ ID:369.

[0724] Another function of VGAM34 is therefore inhibition of LOC221272 (Accession XM_168050). Accordingly, utilities of VGAM34 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221272. LOC221968 (Accession XM_166524) is another VGAM34 host target gene. LOC221968 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221968, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221968 BINDING SITE, designated SEQ ID:3569, to the nucleotide sequence of VGAM34 RNA, herein designated VGAM RNA, also designated SEQ ID:369.

[0725] Another function of VGAM34 is therefore inhibition of LOC221968 (Accession XM_166524). Accordingly, utilities of VGAM34 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221968. LOC86651 (Accession XM_044052) is another VGAM34 host target gene. LOC86651 BINDING SITE is HOST TARGET binding site found in the 5' untranslated

region of mRNA encoded by LOC86651, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC86651 BINDING SITE, designated SEQ ID:2830, to the nucleotide sequence of VGAM34 RNA, herein designated VGAM RNA, also designated SEQ ID:369.

[0726] Another function of VGAM34 is therefore inhibition of LOC86651 (Accession XM_044052). Accordingly, utilities of VGAM34 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC86651. LOC90322 (Accession XM_030903) is another VGAM34 host target gene. LOC90322 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC90322, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90322 BINDING SITE, designated SEQ ID:2632, to the nucleotide sequence of VGAM34 RNA, herein designated VGAM RNA, also designated SEQ ID:369.

[0727] Another function of VGAM34 is therefore inhibition of LOC90322 (Accession XM_030903). Accordingly, utilities

of VGAM34 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90322. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 35 (VGAM35) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[0728] VGAM35 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM35 was detected is described hereinabove with reference to Figs. 1–8.

[0729] VGAM35 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus. VGAM35 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[0730] VGAM35 gene encodes a VGAM35 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM35 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM35 precursor RNA is designated SEQ

ID:21, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:21 is located at position 642 relative to the genome of Vaccinia Virus.

[0731] VGAM35 precursor RNA folds onto itself, forming VGAM35 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[0732] An enzyme complex designated DICER COMPLEX, `dices` the VGAM35 folded precursor RNA into VGAM35 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 92%) nucleotide sequence of VGAM35 RNA is designated SEQ ID:370, and is provided hereinbelow with reference to the sequence list-

ing part.

[0733] VGAM35 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM35 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM35 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[0734] VGAM35 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM35 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM35 RNA is an accurate or a partial inverted-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM35 RNA, herein designated VGAM RNA, may have a different num-

ber of host target binding sites in untranslated regions of a VGAM35 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR and 5' UTR regions.

[0735] The complementary binding of VGAM35 RNA, herein designated VGAM RNA, to host target binding sites on VGAM35 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM35 host target RNA into VGAM35 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[0736] It is appreciated that VGAM35 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM35 host target genes. The mRNA of each one of this plurality of VGAM35 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM35 RNA, herein designated VGAM RNA, and which when bound by VGAM35 RNA causes in–

hibition of translation of respective one or more VGAM35 host target proteins.

[0737] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM35 gene, herein designated VGAM GENE, on one or more VGAM35 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[0738] It is yet further appreciated that a function of VGAM35 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM35 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific

functions, and accordingly utilities, of VGAM35 correlate with, and may be deduced from, the identity of the host target genes which VGAM35 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[0739] Nucleotide sequences of the VGAM35 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM35 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM35 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM35 are further described hereinbelow with reference to Table 1.

[0740] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM35 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM35 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[0741] As mentioned hereinabove with reference to Fig. 1, a function of VGAM35 gene, herein designated VGAM is inhibition of expression of VGAM35 target genes. It is appreciated that specific functions, and accordingly utilities,

of VGAM35 correlate with, and may be deduced from, the identity of the target genes which VGAM35 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[0742] Myosin IE (MYO1E, Accession NM_004998) is a VGAM35 host target gene. MYO1E BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MYO1E, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MYO1E BINDING SITE, designated SEQ ID:1168, to the nucleotide sequence of VGAM35 RNA, herein designated VGAM RNA, also designated SEQ ID:370.

[0743] A function of VGAM35 is therefore inhibition of Myosin IE (MYO1E, Accession NM_004998), a gene which is an unconventional myosin. Accordingly, utilities of VGAM35 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MYO1E. The function of MYO1E has been established by previous studies. Bement et al. (1994) cloned a human unconventional myosin gene, MYO1E, encoding a predicted 127-kD polypeptide of 1,109 amino acids. The gene, which they designated

myosin IC, contains a characteristic N-terminal myosin head, a single 'IQ motif' predicted to bind a single myosin light chain, and a C-terminal tail with a putative membrane-binding site. They also noted the presence of a C-terminal src-homology domain, reminiscent of 'long-tailed' myosins I from amoeboid organisms. By Northern analysis, Bement et al. (1994) detected ubiquitous expression of MYO1E. Hasson et al. (1996) used fluorescence in situ hybridization to map the loci for 4 unconventional myosin loci in humans: MYO1E (formerly MYO1C), MYO1A (OMIM Ref. No. 601478), MYO1F (OMIM Ref. No. 601480), and MYO10 (OMIM Ref. No. 601481). The MYO1E gene was found to be located on 15q21-q22 in the precise location predicted from its location on chromosome 9 of the mouse.

[0744] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[0745] Bement, W. M.; Wirth, J. A.; Mooseker, M. S. : Cloning and mRNA expression of human unconventional myosin-IC: a homologue of amoeboid myosins-I with a single IQ motif and an SH3 domain. J. Molec. Biol. 243: 356-363, 1994. ; and

[0746] Hasson, T.; Skowron, J. F.; Gilbert, D. J.; Avraham, K. B.; Perry, W. L.; Bement, W. M.; Anderson, B. L.; Sherr, E. H.; Chen, Z.-Y.; Greene, L. A.; Ward, D. C.; Corey, D. P.; Mooseker.

[0747] Further studies establishing the function and utilities of MYO1E are found in John Hopkins OMIM database record ID 601479, and in cited publications numbered 150 and 1615 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Rho-associated, Coiled-coil Containing Protein Kinase 2 (ROCK2, Accession XM_038377) is another VGAM35 host target gene. ROCK2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ROCK2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ROCK2 BINDING SITE, designated SEQ ID:2737, to the nucleotide sequence of VGAM35 RNA, herein designated VGAM RNA, also designated SEQ ID:370.

[0748] Another function of VGAM35 is therefore inhibition of Rho-associated, Coiled-coil Containing Protein Kinase 2 (ROCK2, Accession XM_038377), a gene which regulates

cytokinesis, smooth muscle contraction, the formation of actin stress fibers and focal adhesions. Accordingly, utilities of VGAM35 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ROCK2. The function of ROCK2 has been established by previous studies. ROCK2 is a serine/threonine kinase that regulates cytokinesis, smooth muscle contraction, the formation of actin stress fibers and focal adhesions, and the activation of the c-fos (OMIM Ref. No. 164810) serum response element. ROCK2, which is an isozyme of ROCK1 (OMIM Ref. No. 601702), is a target for the small GTPase Rho (e.g., 165390). Nakamura et al. (2001) studied the role of Rho in the migration of corneal epithelial cells in rabbit. They detected both ROCK1 (OMIM Ref. No. 601702) and ROCK2 in the corneal epithelium at protein and mRNA levels. They found that exoenzyme C3, a Rho inhibitor, inhibits corneal epithelial migration in a dose-dependent manner and prevents the stimulatory effect of the Rho activator lysophosphatidic acid (LPA). Both cytochalasin B, an inhibitor of actin filament assembly, and ML7, an inhibitor of myosin light chain kinase, also prevent LPA stimulation of epithelial migration. The authors suggested that Rho mediates corneal epithelial migration

in response to external stimuli by regulating the organization of the actin cytoskeleton. Rao et al. (2001) investigated the role of Rho kinase in the modulation of aqueous humor outflow facility. The treatment of human trabecular meshwork and canal of Schlemm cells with a Rho kinase-specific inhibitor led to significant but reversible changes in cell shape and decreased actin stress fibers, focal adhesions, and protein phosphotyrosine staining. Based on the Rho kinase inhibitor-induced changes in myosin light chain phosphorylation and actomyosin organization, the authors suggested that cellular relaxation and loss of cell-substratum adhesions in the human trabecular meshwork and canal of Schlemm cells could result in either increased paracellular fluid flow across the canal of Schlemm or altered flow pathway through the juxtacanalicular tissue, thereby lowering resistance to outflow. They suggested Rho kinase as a potential target for the development of drugs to modulate intraocular pressure in glaucoma patients.

[0749] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[0750] Nakamura, M.; Nagano, T.; Chikama, T.; Nishida, T. : Role

of the small GTP-binding protein Rho in epithelial cell migration in the rabbit cornea. Invest. Ophthalm. Vis. Sci. 42: 941-947, 2001. ; and

[0751] Rao, P. V.; Deng, P.-F.; Kumar, J.; Epstein, D. L. : Modulation of aqueous humor outflow facility by the Rho kinase-specific inhibitor Y-27632. Invest. Ophthalm. Vis. Sci. 42: 1029-1037.

[0752] Further studies establishing the function and utilities of ROCK2 are found in John Hopkins OMIM database record ID 604002, and in cited publications numbered 2136, 2511-251 and 1667 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. MGC15937 (Accession NM_080661) is another VGAM35 host target gene. MGC15937 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MGC15937, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC15937 BINDING SITE, designated SEQ ID:2383, to the nucleotide sequence of VGAM35 RNA, herein designated VGAM RNA, also designated SEQ ID:370.

[0753] Another function of VGAM35 is therefore inhibition of

MGC15937 (Accession NM_080661). Accordingly, utilities of VGAM35 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC15937. Serine/threonine Kinase 16 (STK16, Accession XM_050904) is another VGAM35 host target gene. STK16 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by STK16, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of STK16 BINDING SITE, designated SEQ ID:2937, to the nucleotide sequence of VGAM35 RNA, herein designated VGAM RNA, also designated SEQ ID:370.

[0754] Another function of VGAM35 is therefore inhibition of Serine/threonine Kinase 16 (STK16, Accession XM_050904). Accordingly, utilities of VGAM35 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STK16. LOC148029 (Accession XM_086014) is another VGAM35 host target gene. LOC148029 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC148029, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING

SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148029 BINDING SITE, designated SEQ ID:3116, to the nucleotide sequence of VGAM35 RNA, herein designated VGAM RNA, also designated SEQ ID:370.

[0755] Another function of VGAM35 is therefore inhibition of LOC148029 (Accession XM_086014). Accordingly, utilities of VGAM35 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148029. LOC169436 (Accession XM_095696) is another VGAM35 host target gene. LOC169436 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC169436, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC169436 BINDING SITE, designated SEQ ID:3261, to the nucleotide sequence of VGAM35 RNA, herein designated VGAM RNA, also designated SEQ ID:370.

[0756] Another function of VGAM35 is therefore inhibition of LOC169436 (Accession XM_095696). Accordingly, utilities of VGAM35 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC169436. LOC256267 (Accession XM_173007) is another VGAM35 host target gene. LOC256267 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC256267, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256267 BINDING SITE, designated SEQ ID:3713, to the nucleotide sequence of VGAM35 RNA, herein designated VGAM RNA, also designated SEQ ID:370.

[0757] Another function of VGAM35 is therefore inhibition of LOC256267 (Accession XM_173007). Accordingly, utilities of VGAM35 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256267. LOC257426 (Accession XM_039451) is another VGAM35 host target gene. LOC257426 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC257426, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257426 BINDING SITE, designated SEQ ID:2755, to the nucleotide sequence of VGAM35 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:370.

[0758] Another function of VGAM35 is therefore inhibition of LOC257426 (Accession XM_039451). Accordingly, utilities of VGAM35 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257426. LOC92466 (Accession XM_045251) is another VGAM35 host target gene. LOC92466 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC92466, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92466 BINDING SITE, designated SEQ ID:2858, to the nucleotide sequence of VGAM35 RNA, herein designated VGAM RNA, also designated SEQ ID:370.

[0759] Another function of VGAM35 is therefore inhibition of LOC92466 (Accession XM_045251). Accordingly, utilities of VGAM35 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92466. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 36 (VGAM36) viral gene, which modu-

lates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[0760] VGAM36 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM36 was detected is described hereinabove with reference to Figs. 1–8.

[0761] VGAM36 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus. VGAM36 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[0762] VGAM36 gene encodes a VGAM36 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM36 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM36 precursor RNA is designated SEQ ID:22, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:22 is located at position 3549 relative to the genome of Vaccinia Virus.

[0763] VGAM36 precursor RNA folds onto itself, forming VGAM36 folded precursor RNA, herein designated VGAM FOLDED

PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[0764] An enzyme complex designated DICER COMPLEX, `dices` the VGAM36 folded precursor RNA into VGAM36 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 74%) nucleotide sequence of VGAM36 RNA is designated SEQ ID:371, and is provided hereinbelow with reference to the sequence listing part.

[0765] VGAM36 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM36 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM36 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a

5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[0766] VGAM36 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM36 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM36 RNA is an accurate or a partial inverted-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM36 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM36 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR

region, or in both 3`UTR and 5`UTR regions.

[0767] The complementary binding of VGAM36 RNA, herein designated VGAM RNA, to host target binding sites on VGAM36 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM36 host target RNA into VGAM36 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[0768] It is appreciated that VGAM36 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM36 host target genes. The mRNA of each one of this plurality of VGAM36 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM36 RNA, herein designated VGAM RNA, and which when bound by VGAM36 RNA causes inhibition of translation of respective one or more VGAM36 host target proteins.

[0769] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM36 gene, herein designated VGAM GENE, on one or

more VGAM36 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[0770] It is yet further appreciated that a function of VGAM36 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM36 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM36 correlate with, and may be deduced from, the identity of the host target genes which VGAM36 binds and inhibits, and the function of these host target genes, as elaborated herein-below.

[0771] Nucleotide sequences of the VGAM36 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the
`diced` VGAM36 RNA, herein designated VGAM RNA, and
a schematic representation of the secondary folding of
VGAM36 folded precursor RNA, herein designated VGAM
FOLDED PRECURSOR RNA, of VGAM36 are further de-
scribed hereinbelow with reference to Table 1.

[0772] Nucleotide sequences of host target binding sites, such as
BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of
Fig. 1, found on VGAM36 host target RNA, and schematic
representation of the complementarity of each of these
host target binding sites to VGAM36 RNA, herein desig-
nated VGAM RNA, are described hereinbelow with refer-
ence to Table 2.

[0773] As mentioned hereinabove with reference to Fig. 1, a
function of VGAM36 gene, herein designated VGAM is in-
hibition of expression of VGAM36 target genes. It is ap-
preciated that specific functions, and accordingly utilities,
of VGAM36 correlate with, and may be deduced from, the
identity of the target genes which VGAM36 binds and in-
hibits, and the function of these target genes, as elabo-
rated hereinbelow.

[0774] Membrane Metallo-endopeptidase (neutral endopepti-
dase, enkephalinase, CALLA, CD10) (MME, Accession

NM_000902) is a VGAM36 host target gene. MME BINDING SITE1 through MME BINDING SITE4 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by MME, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MME BINDING SITE1 through MME BINDING SITE4, designated SEQ ID:785, SEQ ID:1377, SEQ ID:1378 and SEQ ID:1379 respectively, to the nucleotide sequence of VGAM36 RNA, herein designated VGAM RNA, also designated SEQ ID:371.

[0775] A function of VGAM36 is therefore inhibition of Membrane Metallo–endopeptidase (neutral endopeptidase, enkephalinase, CALLA, CD10) (MME, Accession NM_000902), a gene which is thermolysin–like specificity. Accordingly, utilities of VGAM36 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MME. The function of MME has been established by previous studies. Common acute lymphocytic leukemia antigen is an important cell surface marker in the diagnosis of human acute lymphocytic leukemia (ALL). It is present on leukemic cells of pre–B phenotype, which represent 85% of cases of ALL. CALLA is not restricted to

leukemic cells, however, and is found on a variety of normal tissues. CALLA is a glycoprotein that is particularly abundant in kidney, where it is present on the brush border of proximal tubules and on glomerular epithelium. Letarte et al. (1988) cloned a cDNA coding for CALLA and showed that the amino acid sequence deduced from the cDNA sequence is identical to that of human membrane-associated neutral endopeptidase (NEP; EC 3.4.24.11), also known as enkephalinase. NEP cleaves peptides at the amino side of hydrophobic residues and inactivates several peptide hormones including glucagon, enkephalins, substance P, neurotensin, oxytocin, and bradykinin. By cDNA transfection analysis, Shipp et al. (1989) confirmed that CALLA is a functional neutral endopeptidase of the type that has previously been called enkephalinase. Barker et al. (1989) demonstrated that the CALLA gene, which encodes a 100-kD type II transmembrane glycoprotein, exists in a single copy of greater than 45 kb which is not rearranged in malignancies expressing cell surface CALLA. D'Adamio et al. (1989) demonstrated that the CALLA gene spans more than 80 kb and is composed of 24 exons. Animal model experiments lend further support to the function of MME. Amyloid-beta peptide (OMIM Ref. No.

104760), the pathogenic agent of Alzheimer disease (OMIM Ref. No. 104300), is a physiologic metabolite in the brain. Iwata et al. (2001) examined the role of neprilysin, a candidate amyloid-beta degrading peptidase, in the metabolism using neprilysin gene-disrupted mice. Neprilysin deficiency resulted in defects both in the degradation of exogenously administered amyloid-beta and in the metabolic suppression of the endogenous amyloid-beta levels in a gene dose-dependent manner. The regional levels of amyloid-beta in the neprilysin-deficient mouse brain were in the distinct order of hippocampus, cortex, thalamus/striatum, and cerebellum, where hippocampus has the highest level and cerebellum the lowest, correlating with the vulnerability to amyloid-beta deposition in brains of humans with Alzheimer disease. Iwata et al. (2001) concluded that even partial downregulation of neprilysin activity, which could be caused by aging, can contribute to Alzheimer disease by promoting amyloid-beta accumulation.

[0776] It is appreciated that the abovementioned animal model for MME is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[0777] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[0778] Iwata, N.; Tsubuki, S.; Takaki, Y.; Shirotani, K.; Lu, B.; Gerard, N. P.; Gerard, C.; Hama, E.; Lee, H.-J.; Saido, T. C. : Metabolic regulation of brain A-beta by neprilysin. Science 292: 1550-1552, 2001. ; and

[0779] Letarte, M.; Vera, S.; Tran, R.; Addis, J. B. L.; Onizuka, R. J.; Quackenbush, E. J.; Jongeneel, C. V.; McInnes, R. R. : Common acute lymphocytic leukemia antigen is identical to neutr.

[0780] Further studies establishing the function and utilities of MME are found in John Hopkins OMIM database record ID 120520, and in cited publications numbered 2865-2867, 91 and 2868-2870 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. FLJ11275 (Accession NM_018376) is another VGAM36 host target gene. FLJ11275 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ11275, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11275 BINDING

SITE, designated SEQ ID:1821, to the nucleotide sequence of VGAM36 RNA, herein designated VGAM RNA, also designated SEQ ID:371.

[0781] Another function of VGAM36 is therefore inhibition of FLJ11275 (Accession NM_018376). Accordingly, utilities of VGAM36 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11275. Golgi Phosphoprotein 3 (coat-protein) (GOLPH3, Accession NM_022130) is another VGAM36 host target gene. GOLPH3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GOLPH3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GOLPH3 BINDING SITE, designated SEQ ID:1981, to the nucleotide sequence of VGAM36 RNA, herein designated VGAM RNA, also designated SEQ ID:371.

[0782] Another function of VGAM36 is therefore inhibition of Golgi Phosphoprotein 3 (coat-protein) (GOLPH3, Accession NM_022130). Accordingly, utilities of VGAM36 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GOLPH3. KIAA0563

(Accession NM_014834) is another VGAM36 host target gene. KIAA0563 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA0563, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0563 BINDING SITE, designated SEQ ID:1565, to the nucleotide sequence of VGAM36 RNA, herein designated VGAM RNA, also designated SEQ ID:371.

[0783] Another function of VGAM36 is therefore inhibition of KIAA0563 (Accession NM_014834). Accordingly, utilities of VGAM36 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0563. TAF2 RNA Polymerase II, TATA Box Binding Protein (TBP)-associated Factor, 150kDa (TAF2, Accession NM_003184) is another VGAM36 host target gene. TAF2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TAF2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TAF2 BINDING SITE, designated SEQ ID:997, to the nu-

cleotide sequence of VGAM36 RNA, herein designated VGAM RNA, also designated SEQ ID:371.

[0784] Another function of VGAM36 is therefore inhibition of TAF2 RNA Polymerase II, TATA Box Binding Protein (TBP)–associated Factor, 150kDa (TAF2, Accession NM_003184). Accordingly, utilities of VGAM36 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TAF2. LOC147071 (Accession XM_054031) is another VGAM36 host target gene.

LOC147071 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC147071, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147071 BINDING SITE, designated SEQ ID:2965, to the nucleotide sequence of VGAM36 RNA, herein designated VGAM RNA, also designated SEQ ID:371.

[0785] Another function of VGAM36 is therefore inhibition of LOC147071 (Accession XM_054031). Accordingly, utilities of VGAM36 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147071. LOC147639 (Accession XM_085822) is an–

other VGAM36 host target gene. LOC147639 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC147639, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147639 BINDING SITE, designated SEQ ID:3110, to the nucleotide sequence of VGAM36 RNA, herein designated VGAM RNA, also designated SEQ ID:371.

[0786] Another function of VGAM36 is therefore inhibition of LOC147639 (Accession XM_085822). Accordingly, utilities of VGAM36 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147639. LOC201173 (Accession XM_113312) is another VGAM36 host target gene. LOC201173 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC201173, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC201173 BINDING SITE, designated SEQ ID:3405, to the nucleotide sequence of VGAM36 RNA, herein designated VGAM RNA, also designated SEQ ID:371.

[0787] Another function of VGAM36 is therefore inhibition of LOC201173 (Accession XM_113312). Accordingly, utilities of VGAM36 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201173. LOC201220 (Accession XM_113321) is another VGAM36 host target gene. LOC201220 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC201220, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC201220 BINDING SITE, designated SEQ ID:3406, to the nucleotide sequence of VGAM36 RNA, herein designated VGAM RNA, also designated SEQ ID:371.

[0788] Another function of VGAM36 is therefore inhibition of LOC201220 (Accession XM_113321). Accordingly, utilities of VGAM36 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201220. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 37 (VGAM37) viral gene, which modulates expression of respective host target genes thereof,

the function and utility of which host target genes is known in the art.

[0789] VGAM37 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM37 was detected is described hereinabove with reference to Figs. 1–8.

[0790] VGAM37 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus. VGAM37 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[0791] VGAM37 gene encodes a VGAM37 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM37 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM37 precursor RNA is designated SEQ ID:23, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:23 is located at position 3549 relative to the genome of Vaccinia Virus.

[0792] VGAM37 precursor RNA folds onto itself, forming VGAM37 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[0793] An enzyme complex designated DICER COMPLEX, `dices` the VGAM37 folded precursor RNA into VGAM37 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 74%) nucleotide sequence of VGAM37 RNA is designated SEQ ID:372, and is provided hereinbelow with reference to the sequence listing part.

[0794] VGAM37 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM37 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM37 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3`

untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[0795] VGAM37 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM37 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM37 RNA is an accurate or a partial inverted-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM37 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM37 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[0796] The complementary binding of VGAM37 RNA, herein designated VGAM RNA, to host target binding sites on VGAM37 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM37 host target RNA into VGAM37 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[0797] It is appreciated that VGAM37 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM37 host target genes. The mRNA of each one of this plurality of VGAM37 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM37 RNA, herein designated VGAM RNA, and which when bound by VGAM37 RNA causes inhibition of translation of respective one or more VGAM37 host target proteins.

[0798] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM37 gene, herein designated VGAM GENE, on one or more VGAM37 host target gene, herein designated VGAM

HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[0799] It is yet further appreciated that a function of VGAM37 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM37 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM37 correlate with, and may be deduced from, the identity of the host target genes which VGAM37 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[0800] Nucleotide sequences of the VGAM37 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

`diced` VGAM37 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM37 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM37 are further described hereinbelow with reference to Table 1.

[0801] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM37 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM37 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[0802] As mentioned hereinabove with reference to Fig. 1, a function of VGAM37 gene, herein designated VGAM is inhibition of expression of VGAM37 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM37 correlate with, and may be deduced from, the identity of the target genes which VGAM37 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[0803] Membrane Metallo-endopeptidase (neutral endopeptidase, enkephalinase, CALLA, CD10) (MME, Accession NM_000902) is a VGAM37 host target gene. MME BINDING

SITE1 through MME BINDING SITE4 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by MME, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MME BINDING SITE1 through MME BINDING SITE4, designated SEQ ID:785, SEQ ID:1377, SEQ ID:1378 and SEQ ID:1379 respectively, to the nucleotide sequence of VGAM37 RNA, herein designated VGAM RNA, also designated SEQ ID:372.

[0804] A function of VGAM37 is therefore inhibition of Membrane Metallo–endopeptidase (neutral endopeptidase, enkephalinase, CALLA, CD10) (MME, Accession NM_000902), a gene which is thermolysin–like specificity. Accordingly, utilities of VGAM37 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MME. The function of MME and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM36.FLJ11275 (Accession NM_018376) is another VGAM37 host target gene. FLJ11275 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by

FLJ11275, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11275 BINDING SITE, designated SEQ ID:1821, to the nucleotide sequence of VGAM37 RNA, herein designated VGAM RNA, also designated SEQ ID:372.

[0805] Another function of VGAM37 is therefore inhibition of FLJ11275 (Accession NM_018376). Accordingly, utilities of VGAM37 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11275. Golgi Phosphoprotein 3 (coat-protein) (GOLPH3, Accession NM_022130) is another VGAM37 host target gene. GOLPH3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GOLPH3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GOLPH3 BINDING SITE, designated SEQ ID:1981, to the nucleotide sequence of VGAM37 RNA, herein designated VGAM RNA, also designated SEQ ID:372.

[0806] Another function of VGAM37 is therefore inhibition of

Golgi Phosphoprotein 3 (coat-protein) (GOLPH3, Accession NM_022130). Accordingly, utilities of VGAM37 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GOLPH3. KIAA0563 (Accession NM_014834) is another VGAM37 host target gene. KIAA0563 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA0563, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0563 BINDING SITE, designated SEQ ID:1565, to the nucleotide sequence of VGAM37 RNA, herein designated VGAM RNA, also designated SEQ ID:372.

[0807] Another function of VGAM37 is therefore inhibition of KIAA0563 (Accession NM_014834). Accordingly, utilities of VGAM37 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0563. TAF2 RNA Polymerase II, TATA Box Binding Protein (TBP)-associated Factor, 150kDa (TAF2, Accession NM_003184) is another VGAM37 host target gene. TAF2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TAF2, corre-

sponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TAF2 BINDING SITE, designated SEQ ID:997, to the nucleotide sequence of VGAM37 RNA, herein designated VGAM RNA, also designated SEQ ID:372.

[0808] Another function of VGAM37 is therefore inhibition of TAF2 RNA Polymerase II, TATA Box Binding Protein (TBP)-associated Factor, 150kDa (TAF2, Accession NM_003184). Accordingly, utilities of VGAM37 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TAF2. LOC147071 (Accession XM_054031) is another VGAM37 host target gene. LOC147071 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC147071, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147071 BINDING SITE, designated SEQ ID:2965, to the nucleotide sequence of VGAM37 RNA, herein designated VGAM RNA, also designated SEQ ID:372.

[0809] Another function of VGAM37 is therefore inhibition of

LOC147071 (Accession XM_054031). Accordingly, utilities of VGAM37 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147071. LOC147639 (Accession XM_085822) is another VGAM37 host target gene. LOC147639 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC147639, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147639 BINDING SITE, designated SEQ ID:3110, to the nucleotide sequence of VGAM37 RNA, herein designated VGAM RNA, also designated SEQ ID:372.

[0810] Another function of VGAM37 is therefore inhibition of LOC147639 (Accession XM_085822). Accordingly, utilities of VGAM37 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147639. LOC201173 (Accession XM_113312) is another VGAM37 host target gene. LOC201173 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC201173, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC201173 BINDING SITE, designated SEQ ID:3405, to the nucleotide sequence of VGAM37 RNA, herein designated VGAM RNA, also designated SEQ ID:372.

[0811] Another function of VGAM37 is therefore inhibition of LOC201173 (Accession XM_113312). Accordingly, utilities of VGAM37 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201173. LOC201220 (Accession XM_113321) is another VGAM37 host target gene. LOC201220 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC201220, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC201220 BINDING SITE, designated SEQ ID:3406, to the nucleotide sequence of VGAM37 RNA, herein designated VGAM RNA, also designated SEQ ID:372.

[0812] Another function of VGAM37 is therefore inhibition of LOC201220 (Accession XM_113321). Accordingly, utilities of VGAM37 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201220. Fig. 1 further provides a conceptual descrip-

tion of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 38 (VGAM38) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[0813] VGAM38 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM38 was detected is described hereinabove with reference to Figs. 1–8.

[0814] VGAM38 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus. VGAM38 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[0815] VGAM38 gene encodes a VGAM38 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM38 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM38 precursor RNA is designated SEQ ID:24, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:24 is located at position 2981 relative to the genome of Vac–

cinia Virus.

[0816] VGAM38 precursor RNA folds onto itself, forming VGAM38 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[0817] An enzyme complex designated DICER COMPLEX, `dices` the VGAM38 folded precursor RNA into VGAM38 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of VGAM38 RNA is designated SEQ ID:373, and is provided hereinbelow with reference to the sequence listing part.

[0818] VGAM38 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA,

VGAM38 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM38 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[0819] VGAM38 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM38 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM38 RNA is an accurate or a partial inverted-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM38 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM38 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig.

1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[0820] The complementary binding of VGAM38 RNA, herein designated VGAM RNA, to host target binding sites on VGAM38 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM38 host target RNA into VGAM38 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[0821] It is appreciated that VGAM38 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM38 host target genes. The mRNA of each one of this plurality of VGAM38 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM38 RNA, herein designated VGAM RNA, and which when bound by VGAM38 RNA causes inhibition of translation of respective one or more VGAM38 host target proteins.

[0822] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM38 gene, herein designated VGAM GENE, on one or more VGAM38 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[0823] It is yet further appreciated that a function of VGAM38 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM38 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM38 correlate with, and may be deduced from, the identity of the host target genes which VGAM38 binds and inhibits, and the

function of these host target genes, as elaborated herein–below.

[0824] Nucleotide sequences of the VGAM38 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM38 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM38 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM38 are further described hereinbelow with reference to Table 1.

[0825] Nucleotide sequences of host target binding sites, such as BINDING SITE–I, BINDING SITE–II and BINDING SITE–III of Fig. 1, found on VGAM38 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM38 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[0826] As mentioned hereinabove with reference to Fig. 1, a function of VGAM38 gene, herein designated VGAM is inhibition of expression of VGAM38 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM38 correlate with, and may be deduced from, the identity of the target genes which VGAM38 binds and inhibits, and the function of these target genes, as elabo–

rated hereinbelow.

[0827] MAP/microtubule Affinity-regulating Kinase 1 (MARK1, Accession NM_018650) is a VGAM38 host target gene. MARK1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MARK1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MARK1 BINDING SITE, designated SEQ ID:1857, to the nucleotide sequence of VGAM38 RNA, herein designated VGAM RNA, also designated SEQ ID:373.

[0828] A function of VGAM38 is therefore inhibition of MAP/microtubule Affinity-regulating Kinase 1 (MARK1, Accession NM_018650), a gene which phosphorylate microtubule-associated proteins and trigger microtubule disruption. Accordingly, utilities of VGAM38 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MARK1. The function of MARK1 has been established by previous studies. The microtubule array has a central role in the regulation of cell shape and polarity during differentiation, chromosome partitioning at mitosis, and intracellular transport. Microtubules un-

dergo rearrangements involving rapid transitions between stable and dynamic states during these processes. By RT-PCR of rat and human brain mRNA, followed by PCR with primers based on the rat sequences, Drewes et al. (1997) cloned human genes for MARK1 and MARK2 (see OMIM Ref. No. EMK1, 600526). The rat protein has 793 amino acids. Northern blot analysis with rat probes revealed expression of a 4.1-kb transcript with highest levels in heart and muscle. By searching for sequences encoding large proteins expressed in brain, Nagase et al. (2000) identified a partial cDNA encoding MARK1, which they termed KIAA1477. The 870-amino acid protein is 90% identical to the rat serine/threonine kinase Mark1. RT-PCR analysis detected ubiquitous expression at highest levels in testis and brain. Within brain, highest levels were detected in hippocampus. By radiation hybrid analysis, Nagase et al. (2000) mapped the MARK1 gene to chromosome 1.

[0829] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[0830] Drewes, G.; Ebner, A.; Preuss, U.; Mandelkow, E. M.; Mandelkow, E. : MARK, a novel family of protein kinases that phosphorylate microtubule-associated proteins and

trigger microtubule disruption. Cell 89: 297–308, 1997. ;
and

[0831] Nagase, T.; Kikuno, R.; Ishikawa, K.; Hirose, M.; Ohara, O. : Prediction of the coding sequences of unidentified human genes. XVII. The complete sequences of 100 new cDNA clones from.

[0832] Further studies establishing the function and utilities of MARK1 are found in John Hopkins OMIM database record ID 606511, and in cited publications numbered 1405–1406 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 39 (VGAM39) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[0833] VGAM39 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM39 was detected is described hereinabove with reference to Figs. 1–8.

[0834] VGAM39 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus. VGAM39

host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[0835] VGAM39 gene encodes a VGAM39 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM39 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM39 precursor RNA is designated SEQ ID:25, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:25 is located at position 963 relative to the genome of Vaccinia Virus.

[0836] VGAM39 precursor RNA folds onto itself, forming VGAM39 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[0837] An enzyme complex designated DICER COMPLEX, `dices` the VGAM39 folded precursor RNA into VGAM39 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 92%) nucleotide sequence of VGAM39 RNA is designated SEQ ID:374, and is provided hereinbelow with reference to the sequence listing part.

[0838] VGAM39 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM39 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM39 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[0839] VGAM39 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM39 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM39 RNA is an accurate or a partial in-

versed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM39 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM39 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[0840] The complementary binding of VGAM39 RNA, herein designated VGAM RNA, to host target binding sites on VGAM39 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM39 host target RNA into VGAM39 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[0841] It is appreciated that VGAM39 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM39 host target genes. The mRNA of each one of this plurality of VGAM39 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM39 RNA, herein designated VGAM RNA, and which when bound by VGAM39 RNA causes inhibition of translation of respective one or more VGAM39 host target proteins.

[0842] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM39 gene, herein designated VGAM GENE, on one or more VGAM39 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although spe-

cific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[0843] It is yet further appreciated that a function of VGAM39 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM39 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM39 correlate with, and may be deduced from, the identity of the host target genes which VGAM39 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[0844] Nucleotide sequences of the VGAM39 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM39 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM39 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM39 are further described hereinbelow with reference to Table 1.

[0845] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM39 host target RNA, and schematic

representation of the complementarity of each of these host target binding sites to VGAM39 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[0846] As mentioned hereinabove with reference to Fig. 1, a function of VGAM39 gene, herein designated VGAM is inhibition of expression of VGAM39 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM39 correlate with, and may be deduced from, the identity of the target genes which VGAM39 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[0847] Dickkopf Homolog 1 (*Xenopus laevis*) (DKK1, Accession NM_012242) is a VGAM39 host target gene. DKK1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKK1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKK1 BINDING SITE, designated SEQ ID:1417, to the nucleotide sequence of VGAM39 RNA, herein designated VGAM RNA, also designated SEQ ID:374.

[0848] A function of VGAM39 is therefore inhibition of Dickkopf

Homolog 1 (*Xenopus laevis*) (DKK1, Accession NM_012242), a gene which is a growth factor and inhibits Wnt signaling. Accordingly, utilities of VGAM39 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKK1. The function of DKK1 has been established by previous studies. Roessler et al. (2000) identified 4 heterozygous sequence alterations in the DKK1 gene in patients with holoprosencephaly (HPE; OMIM Ref. No. 236100). Functional analysis of the alterations, however, revealed preserved activity in frog ectopic head assays, suggesting a limited role for DKK1 in HPE. Lrp6 (OMIM Ref. No. 603507) is required during Wnt/beta-catenin signaling in *Drosophila*, *Xenopus*, and mouse, possibly acting as a coreceptor for Wnt. Mao et al. (2001) showed that LRP6 is a specific, high affinity receptor for DKK1 and DKK2. DKK1 blocks Lrp6-mediated Wnt/beta-catenin signaling by interacting with domains that are distinct from those required for Wnt/frizzled (OMIM Ref. No. 600667) interaction. DKK1 and Lrp6 interact antagonistically during embryogenic head induction in *Xenopus* where Lrp6 promotes the posteriorizing role of Wnt/beta-catenin signaling. Thus, DKKs inhibit Wnt coreceptor function, exemplifying the modula-

tion of LRP signaling by antagonists

for Dickkopf proteins. *Nature* 411: 321–325, 2001.
- [0852] Further studies establishing the function and utilities of
DKK1 are found in John Hopkins OMIM database record ID
605189, and in cited publications numbered 1137–113
and 1824 listed in the bibliography section hereinbelow,
which are also hereby incorporated by refer-
ence. Keratocan (KERA, Accession NM_007035) is another
VGAM39 host target gene. KERA BINDING SITE is HOST
TARGET binding site found in the 3' untranslated region
of mRNA encoded by KERA, corresponding to a HOST
TARGET binding site such as BINDING SITE I, BINDING SITE

II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KERA BINDING SITE, designated SEQ ID:1349, to the nucleotide sequence of VGAM39 RNA, herein designated VGAM RNA, also designated SEQ ID:374.

[0853] Another function of VGAM39 is therefore inhibition of Keratocan (KERA, Accession NM_007035), a gene which may be important in developing and maintaining corneal transparency and for the structure of the stromal matrix. Accordingly, utilities of VGAM39 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KERA. The function of KERA has been established by previous studies. Keratan sulfate proteoglycans (KSPGs) are members of the small leucine-rich proteoglycan (SLRP) family. KSPGs, particularly keratocan, lumican (OMIM Ref. No. 600616), and mimecan (OMIM Ref. No. 602383), are important to the transparency of the cornea. Liu et al. (1998) isolated mouse keratocan cDNA and genomic DNA. Mouse keratocan cDNA predicts a 351-amino acid polypeptide containing a conserved central leucine-rich repeat region. Northern blot analysis of mouse tissues revealed that keratocan is expressed selectively in the eye throughout development. In situ hy-

bridization demonstrated that keratocan is expressed early in neural crest development and later in corneal stromal cells. Tasheva et al. (1999) isolated the cDNA and identified the genomic structure of the human keratocan gene. The gene is spread over 7.65 kb of DNA and contains 3 exons. An open reading frame starting at the beginning of the second exon encodes a protein of 352 amino acids. The amino acid sequence of keratocan shows high identity among mammalian species. This evolutionary conservation between the keratocan proteins as well as the restricted expression of the KERA gene in cornea suggests that this molecule might be important in developing and maintaining corneal transparency.

[0854] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[0855] Liu, C.-Y.; Shiraishi, A.; Kao, C. W.-C.; Converse, R. L.; Funderburgh, J. L.; Corpuz, L. M.; Conrad, G. W.; Kao, W. W.-Y. : The cloning of mouse keratocan cDNA and genomic DNA and the characterization of its expression during eye development. J. Biol. Chem. 273: 22584-22588, 1998. ; and

Corpuz, L. M.; Conrad, G. W. : Structure and sequence of the gene encoding human keratocan. DNA Seq. 10: 67–74, 1999.

[0857] Further studies establishing the function and utilities of KERA are found in John Hopkins OMIM database record ID 603288, and in cited publications numbered 1217, 2270, 84 and 1219–1220 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Protein Phosphatase 1, Regulatory (inhibitor) Subunit 12A (PPP1R12A, Accession NM_002480) is another VGAM39 host target gene. PPP1R12A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PPP1R12A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PPP1R12A BINDING SITE, designated SEQ ID:931, to the nucleotide sequence of VGAM39 RNA, herein designated VGAM RNA, also designated SEQ ID:374.

[0858] Another function of VGAM39 is therefore inhibition of Protein Phosphatase 1, Regulatory (inhibitor) Subunit 12A (PPP1R12A, Accession NM_002480), a gene which regulates the interaction of actin and myosin. Accordingly,

utilities of VGAM39 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPP1R12A. The function of PPP1R12A has been established by previous studies. Kimura et al. (1996) demonstrated that myosin phosphatase regulates the interaction of actin (see OMIM Ref. No. 102540) and myosin (see OMIM Ref. No. 160710) downstream of the guanosine triphosphatase Rho. Rho appears to inhibit myosin phosphatase through the action of Rho-kinase. Using the rat Mypt1 cDNA as probe, Takahashi et al. (1997) cloned a 4,855-bp cDNA for a human gene they symbolized MYPT1. Sequencing analysis showed that human MYPT1 contains 1,030 amino acids with a calculated molecular mass of approximately 115 kD. By fluorescence in situ hybridization, Kimura et al. (1996) mapped the MYPT1 gene to 12q15-q21.2. By radiation hybrid analysis, they showed that MYPT1 is located close to a highly polymorphic marker that lies between D12S350 and D12S106.

[0859] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[0860] Kimura, K.; Ito, M.; Amano, M.; Chihara, K.; Fukata, Y.; Nakafuku, M.; Yamamori, B.; Feng, J.; Nakano, T.; Okawa,

K.; Iwamatsu, A.; Kaibuchi, K. : Regulation of myosin phosphatase by Rho and Rho-associated kinase (Rho-kinase). Science 273: 245–248, 1996. ; and

[0862] Further studies establishing the function and utilities of PPP1R12A are found in John Hopkins OMIM database record ID 602021, and in cited publications numbered 1342–1343 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference.S100 Calcium Binding Protein, Beta (neural) (S100B, Accession NM_006272) is another VGAM39 host target gene. S100B BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by S100B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of S100B BINDING SITE, designated SEQ ID:1284, to the nucleotide sequence of VGAM39 RNA, herein designated VGAM RNA, also designated SEQ ID:374.

[0863] Another function of VGAM39 is therefore inhibition of

S100 Calcium Binding Protein, Beta (neural) (S100B, Accession NM_006272), a gene which weakly binds calcium but binds zinc very tightly—distinct binding sites with different affinities exist for both ions on each monomer. Accordingly, utilities of VGAM39 include diagnosis, prevention and treatment of diseases and clinical conditions associated with S100B. The function of S100B has been established by previous studies. See 176940. The beta-subunit of S100 protein is expressed in glial cells at levels at least tenfold higher than in most other cell types. The brain also contains small amounts of the alpha subunits at levels approximately one-tenth that of the beta subunit. Allore et al. (1988) used genomic and cDNA probes in connection with a panel of rodent–human somatic cell hybrids to assign the S100B gene to 21q22. They suggested that this is a candidate gene for the neurologic disturbances in Down syndrome when present in trisomic state. By in situ hybridization, Duncan et al. (1989) localized the S100B gene to 21q22.2–q22.3. Allore et al. (1990) isolated overlapping genomic clones spanning the region coding for S100B and its flanking sequences. The intron/exon organization is similar to that of the genes coding for several other members of the S100 protein subfamily.

The S100B gene is composed of 3 exons, the first of which specifies the 5-prime untranslated region. Morii et al. (1991) isolated the S100A (OMIM Ref. No. 176940) and S100B genes from a human genomic DNA library. Endonuclease mapping and DNA sequencing showed that both comprise 3 exons and 2 introns. Two Ca(2+)-binding domains were independently encoded by exons 2 and 3. By spot-blot hybridization analysis of flow-sorted chromosomes, Morii et al. (1991) showed that the S100A and S100B genes are located on chromosome 1 and chromosome 21, respectively. Using restriction endonuclease fragment length variations (RFLV) in multipoint backcrosses, Shimizu et al. (1992) mapped the S100b gene in relation to other genes on mouse chromosome 10. The S100B gene is expressed at high levels in brain primarily by astrocytes. Addition of the disulfide-bonded dimeric form of the protein to primary neuronal and glial cultures and established cell lines induces axonal extension and alterations in astrocyte proliferation and phenotype. Reeves et al. (1994) demonstrated that the same effects of the S100B protein are exerted in vivo. They found that both astrogliosis and neurite proliferation occurred in transgenic mice expressing elevated lev-

els of S100b. They suggested that these transgenic mice represent a useful model for studies of the role of S100B in glial-neuronal interactions in normal development and function of the brain and for analyzing the significance of elevated levels of the protein in Down syndrome and Alzheimer disease.

[0864] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[0865] Reeves, R. H.; Yao, J.; Crowley, M. R.; Buck, S.; Zhang, X.; Yarowsky, P.; Gearhart, J. D.; Hilt, D. C. : Astrocytosis and axonal proliferation in the hippocampus of S100b transgenic mice. Proc. Nat. Acad. Sci. 91: 5359–5363, 1994. ; and

[0867] Further studies establishing the function and utilities of S100B are found in John Hopkins OMIM database record ID 176990, and in cited publications numbered 204–206, 297 and 627 listed in the bibliography section hereinbelow, which are also hereby incorporated by refer–

ence.DKFZP564I0422 (Accession NM_031435) is another VGAM39 host target gene. DKFZP564I0422 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZP564I0422, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP564I0422 BINDING SITE, designated SEQ ID:2196, to the nucleotide sequence of VGAM39 RNA, herein designated VGAM RNA, also designated SEQ ID:374.

[0868] Another function of VGAM39 is therefore inhibition of DKFZP564I0422 (Accession NM_031435). Accordingly, utilities of VGAM39 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP564I0422. Echinoderm Microtubule Associated Protein Like 4 (EML4, Accession NM_019063) is another VGAM39 host target gene. EML4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by EML4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EML4 BINDING SITE, designated SEQ ID:1876, to the nucleotide sequence of

VGAM39 RNA, herein designated VGAM RNA, also designated SEQ ID:374.

[0869] Another function of VGAM39 is therefore inhibition of Echinoderm Microtubule Associated Protein Like 4 (EML4, Accession NM_019063). Accordingly, utilities of VGAM39 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EML4. FLJ21657 (Accession NM_022483) is another VGAM39 host target gene. FLJ21657 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ21657, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21657 BINDING SITE, designated SEQ ID:1990, to the nucleotide sequence of VGAM39 RNA, herein designated VGAM RNA, also designated SEQ ID:374.

[0870] Another function of VGAM39 is therefore inhibition of FLJ21657 (Accession NM_022483). Accordingly, utilities of VGAM39 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21657. KIAA1054 (Accession XM_043493) is another VGAM39 host target gene. KIAA1054 BINDING SITE is HOST TARGET

binding site found in the 3' untranslated region of mRNA encoded by KIAA1054, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1054 BINDING SITE, designated SEQ ID:2820, to the nucleotide sequence of VGAM39 RNA, herein designated VGAM RNA, also designated SEQ ID:374.

[0871] Another function of VGAM39 is therefore inhibition of KIAA1054 (Accession XM_043493). Accordingly, utilities of VGAM39 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1054. Sema Domain, Immunoglobulin Domain (Ig), Short Basic Domain, Secreted, (semaphorin) 3E (SEMA3E, Accession NM_012431) is another VGAM39 host target gene. SEMA3E BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by SEMA3E, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SEMA3E BINDING SITE, designated SEQ ID:1431, to the nucleotide sequence of VGAM39 RNA, herein designated VGAM RNA, also designated SEQ

ID:374.

[0872] Another function of VGAM39 is therefore inhibition of Sema Domain, Immunoglobulin Domain (Ig), Short Basic Domain, Secreted, (semaphorin) 3E (SEMA3E, Accession NM_012431). Accordingly, utilities of VGAM39 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SEMA3E. LOC130507 (Accession XM_059440) is another VGAM39 host target gene. LOC130507 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC130507, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC130507 BINDING SITE, designated SEQ ID:3011, to the nucleotide sequence of VGAM39 RNA, herein designated VGAM RNA, also designated SEQ ID:374.

[0873] Another function of VGAM39 is therefore inhibition of LOC130507 (Accession XM_059440). Accordingly, utilities of VGAM39 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC130507. LOC148145 (Accession XM_097410) is another VGAM39 host target gene. LOC148145 BINDING

SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC148145, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148145 BINDING SITE, designated SEQ ID:3296, to the nucleotide sequence of VGAM39 RNA, herein designated VGAM RNA, also designated SEQ ID:374.

[0874] Another function of VGAM39 is therefore inhibition of LOC148145 (Accession XM_097410). Accordingly, utilities of VGAM39 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148145. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 40 (VGAM40) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[0875] VGAM40 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM40 was detected is described hereinabove with reference to Figs. 1–8.

[0876] VGAM40 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus. VGAM40 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[0877] VGAM40 gene encodes a VGAM40 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM40 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM40 precursor RNA is designated SEQ ID:26, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:26 is located at position 963 relative to the genome of Vaccinia Virus.

[0878] VGAM40 precursor RNA folds onto itself, forming VGAM40 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[0879] An enzyme complex designated DICER COMPLEX, `dices` the VGAM40 folded precursor RNA into VGAM40 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 92%) nucleotide sequence of VGAM40 RNA is designated SEQ ID:375, and is provided hereinbelow with reference to the sequence listing part.

[0880] VGAM40 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM40 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM40 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[0881] VGAM40 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM40 host target RNA, herein designated VGAM HOST TARGET RNA. This com-

plementary binding is due to the fact that the nucleotide sequence of VGAM40 RNA is an accurate or a partial inverted-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM40 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM40 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[0882] The complementary binding of VGAM40 RNA, herein designated VGAM RNA, to host target binding sites on VGAM40 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM40 host target RNA into VGAM40 host target protein, herein design-

nated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[0883] It is appreciated that VGAM40 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM40 host target genes. The mRNA of each one of this plurality of VGAM40 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM40 RNA, herein designated VGAM RNA, and which when bound by VGAM40 RNA causes inhibition of translation of respective one or more VGAM40 host target proteins.

[0884] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM40 gene, herein designated VGAM GENE, on one or more VGAM40 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also

believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[0885] It is yet further appreciated that a function of VGAM40 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM40 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM40 correlate with, and may be deduced from, the identity of the host target genes which VGAM40 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[0886] Nucleotide sequences of the VGAM40 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM40 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM40 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM40 are further described hereinbelow with reference to Table 1.

[0887] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM40 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM40 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[0888] As mentioned hereinabove with reference to Fig. 1, a function of VGAM40 gene, herein designated VGAM is inhibition of expression of VGAM40 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM40 correlate with, and may be deduced from, the identity of the target genes which VGAM40 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[0889] Dickkopf Homolog 1 (*Xenopus laevis*) (DKK1, Accession NM_012242) is a VGAM40 host target gene. DKK1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKK1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKK1 BINDING SITE, designated SEQ ID:1417, to the nucleotide sequence of VGAM40 RNA, herein designated VGAM RNA,

also designated SEQ ID:375.

[0890] A function of VGAM40 is therefore inhibition of Dickkopf Homolog 1 (*Xenopus laevis*) (DKK1, Accession NM_012242), a gene which is a growth factor and inhibits Wnt signaling. Accordingly, utilities of VGAM40 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKK1. The function of DKK1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM39. Keratocan (KERA, Accession NM_007035) is another VGAM40 host target gene. KERA BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KERA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KERA BINDING SITE, designated SEQ ID:1349, to the nucleotide sequence of VGAM40 RNA, herein designated VGAM RNA, also designated SEQ ID:375.

[0891] Another function of VGAM40 is therefore inhibition of Keratocan (KERA, Accession NM_007035), a gene which may be important in developing and maintaining corneal

transparency and for the structure of the stromal matrix. Accordingly, utilities of VGAM40 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KERA. The function of KERA and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM39. Protein Phosphatase 1, Regulatory (inhibitor) Subunit 12A (PPP1R12A, Accession NM_002480) is another VGAM40 host target gene.

PPP1R12A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PPP1R12A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PPP1R12A BINDING SITE, designated SEQ ID:931, to the nucleotide sequence of VGAM40 RNA, herein designated VGAM RNA, also designated SEQ ID:375.

[0892] Another function of VGAM40 is therefore inhibition of Protein Phosphatase 1, Regulatory (inhibitor) Subunit 12A (PPP1R12A, Accession NM_002480), a gene which regulates the interaction of actin and myosin. Accordingly, utilities of VGAM40 include diagnosis, prevention and

treatment of diseases and clinical conditions associated with PPP1R12A. The function of PPP1R12A and its association with various diseases and clinical conditions, has been established by previous studies, as described herein above with reference to VGAM39.S100 Calcium Binding Protein, Beta (neural) (S100B, Accession NM_006272) is another VGAM40 host target gene. S100B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by S100B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of S100B BINDING SITE, designated SEQ ID:1284, to the nucleotide sequence of VGAM40 RNA, herein designated VGAM RNA, also designated SEQ ID:375.

[0893] Another function of VGAM40 is therefore inhibition of S100 Calcium Binding Protein, Beta (neural) (S100B, Accession NM_006272), a gene which weakly binds calcium but binds zinc very tightly—distinct binding sites with different affinities exist for both ions on each monomer. Accordingly, utilities of VGAM40 include diagnosis, prevention and treatment of diseases and clinical conditions associated with S100B. The function of S100B and its asso-

ciation with various diseases and clinical conditions, has been established by previous studies, as described herein above with reference to VGAM39.DKFZP564I0422 (Accession NM_031435) is another VGAM40 host target gene. DKFZP564I0422 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP564I0422, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP564I0422 BINDING SITE, designated SEQ ID:2196, to the nucleotide sequence of VGAM40 RNA, herein designated VGAM RNA, also designated SEQ ID:375.

[0894] Another function of VGAM40 is therefore inhibition of DKFZP564I0422 (Accession NM_031435). Accordingly, utilities of VGAM40 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP564I0422. Echinoderm Microtubule Associated Protein Like 4 (EML4, Accession NM_019063) is another VGAM40 host target gene. EML4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EML4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE

II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EML4 BINDING SITE, designated SEQ ID:1876, to the nucleotide sequence of VGAM40 RNA, herein designated VGAM RNA, also designated SEQ ID:375.

[0895] Another function of VGAM40 is therefore inhibition of Echinoderm Microtubule Associated Protein Like 4 (EML4, Accession NM_019063). Accordingly, utilities of VGAM40 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EML4. FLJ21657 (Accession NM_022483) is another VGAM40 host target gene. FLJ21657 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ21657, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21657 BINDING SITE, designated SEQ ID:1990, to the nucleotide sequence of VGAM40 RNA, herein designated VGAM RNA, also designated SEQ ID:375.

[0896] Another function of VGAM40 is therefore inhibition of FLJ21657 (Accession NM_022483). Accordingly, utilities of VGAM40 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with FLJ21657. KIAA1054 (Accession XM_043493) is another VGAM40 host target gene. KIAA1054 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1054, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1054 BINDING SITE, designated SEQ ID:2820, to the nucleotide sequence of VGAM40 RNA, herein designated VGAM RNA, also designated SEQ ID:375.

[0897] Another function of VGAM40 is therefore inhibition of KIAA1054 (Accession XM_043493). Accordingly, utilities of VGAM40 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1054. Sema Domain, Immunoglobulin Domain (Ig), Short Basic Domain, Secreted, (semaphorin) 3E (SEMA3E, Accession NM_012431) is another VGAM40 host target gene. SEMA3E BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by SEMA3E, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of SEMA3E BINDING SITE, designated SEQ ID:1431, to the nucleotide sequence of VGAM40 RNA, herein designated VGAM RNA, also designated SEQ ID:375.

[0898] Another function of VGAM40 is therefore inhibition of Sema Domain, Immunoglobulin Domain (Ig), Short Basic Domain, Secreted, (semaphorin) 3E (SEMA3E, Accession NM_012431). Accordingly, utilities of VGAM40 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SEMA3E. LOC130507 (Accession XM_059440) is another VGAM40 host target gene. LOC130507 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC130507, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC130507 BINDING SITE, designated SEQ ID:3011, to the nucleotide sequence of VGAM40 RNA, herein designated VGAM RNA, also designated SEQ ID:375.

[0899] Another function of VGAM40 is therefore inhibition of LOC130507 (Accession XM_059440). Accordingly, utilities of VGAM40 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LOC130507. LOC148145 (Accession XM_097410) is another VGAM40 host target gene. LOC148145 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC148145, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148145 BINDING SITE, designated SEQ ID:3296, to the nucleotide sequence of VGAM40 RNA, herein designated VGAM RNA, also designated SEQ ID:375.

[0900] Another function of VGAM40 is therefore inhibition of LOC148145 (Accession XM_097410). Accordingly, utilities of VGAM40 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148145. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 41 (VGAM41) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[0901] VGAM41 is a novel bioinformatically detected regulatory,

non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM41 was detected is described hereinabove with reference to Figs. 1–8.

[0902] VGAM41 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus. VGAM41 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[0903] VGAM41 gene encodes a VGAM41 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM41 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM41 precursor RNA is designated SEQ ID:27, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:27 is located at position 963 relative to the genome of Vaccinia Virus.

[0904] VGAM41 precursor RNA folds onto itself, forming VGAM41 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first

half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[0905] An enzyme complex designated DICER COMPLEX, `dices` the VGAM41 folded precursor RNA into VGAM41 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 92%) nucleotide sequence of VGAM41 RNA is designated SEQ ID:376, and is provided hereinbelow with reference to the sequence listing part.

[0906] VGAM41 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM41 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM41 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[0907] VGAM41 RNA, herein designated VGAM RNA, binds com-

plementarily to one or more host target binding sites located in untranslated regions of VGAM41 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM41 RNA is an accurate or a partial inverted-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM41 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM41 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[0908] The complementary binding of VGAM41 RNA, herein designated VGAM RNA, to host target binding sites on VGAM41 host target RNA, herein designated VGAM HOST

TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM41 host target RNA into VGAM41 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[0909] It is appreciated that VGAM41 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM41 host target genes. The mRNA of each one of this plurality of VGAM41 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM41 RNA, herein designated VGAM RNA, and which when bound by VGAM41 RNA causes inhibition of translation of respective one or more VGAM41 host target proteins.

[0910] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM41 gene, herein designated VGAM GENE, on one or more VGAM41 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific

complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[0911] It is yet further appreciated that a function of VGAM41 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM41 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM41 correlate with, and may be deduced from, the identity of the host target genes which VGAM41 binds and inhibits, and the function of these host target genes, as elaborated herein-below.

[0912] Nucleotide sequences of the VGAM41 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM41 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM41 folded precursor RNA, herein designated VGAM

FOLDED PRECURSOR RNA, of VGAM41 are further described hereinbelow with reference to Table 1.

[0913] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM41 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM41 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[0914] As mentioned hereinabove with reference to Fig. 1, a function of VGAM41 gene, herein designated VGAM is inhibition of expression of VGAM41 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM41 correlate with, and may be deduced from, the identity of the target genes which VGAM41 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[0915] Dickkopf Homolog 1 (*Xenopus laevis*) (DKK1, Accession NM_012242) is a VGAM41 host target gene. DKK1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKK1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates

the complementarity of the nucleotide sequences of DKK1 BINDING SITE, designated SEQ ID:1417, to the nucleotide sequence of VGAM41 RNA, herein designated VGAM RNA, also designated SEQ ID:376.

[0916] A function of VGAM41 is therefore inhibition of Dickkopf Homolog 1 (*Xenopus laevis*) (DKK1, Accession NM_012242), a gene which is a growth factor and inhibits Wnt signaling. Accordingly, utilities of VGAM41 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKK1. The function of DKK1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM39. Keratocan (KERA, Accession NM_007035) is another VGAM41 host target gene. KERA BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KERA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KERA BINDING SITE, designated SEQ ID:1349, to the nucleotide sequence of VGAM41 RNA, herein designated VGAM RNA, also designated SEQ ID:376.

[0917] Another function of VGAM41 is therefore inhibition of Keratocan (KERA, Accession NM_007035), a gene which may be important in developing and maintaining corneal transparency and for the structure of the stromal matrix. Accordingly, utilities of VGAM41 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KERA. The function of KERA and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM39. Protein Phosphatase 1, Regulatory (inhibitor) Subunit 12A (PPP1R12A, Accession NM_002480) is another VGAM41 host target gene. PPP1R12A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PPP1R12A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PPP1R12A BINDING SITE, designated SEQ ID:931, to the nucleotide sequence of VGAM41 RNA, herein designated VGAM RNA, also designated SEQ ID:376.

[0918] Another function of VGAM41 is therefore inhibition of Protein Phosphatase 1, Regulatory (inhibitor) Subunit 12A

(PPP1R12A, Accession NM_002480), a gene which regulates the interaction of actin and myosin. Accordingly, utilities of VGAM41 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPP1R12A. The function of PPP1R12A and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM39.S100 Calcium Binding Protein, Beta (neural) (S100B, Accession NM_006272) is another VGAM41 host target gene. S100B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by S100B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of S100B BINDING SITE, designated SEQ ID:1284, to the nucleotide sequence of VGAM41 RNA, herein designated VGAM RNA, also designated SEQ ID:376.

[0919] Another function of VGAM41 is therefore inhibition of S100 Calcium Binding Protein, Beta (neural) (S100B, Accession NM_006272), a gene which weakly binds calcium but binds zinc very tightly—distinct binding sites with different affinities exist for both ions on each monomer. Ac-

cordingly, utilities of VGAM41 include diagnosis, prevention and treatment of diseases and clinical conditions associated with S100B. The function of S100B and its association with various diseases and clinical conditions, has been established by previous studies, as described herein above with reference to VGAM39.DKFZP564I0422

(Accession NM_031435) is another VGAM41 host target gene. DKFZP564I0422 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP564I0422, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP564I0422 BINDING SITE, designated SEQ ID:2196, to the nucleotide sequence of VGAM41 RNA, herein designated VGAM RNA, also designated SEQ ID:376.

[0920] Another function of VGAM41 is therefore inhibition of DKFZP564I0422 (Accession NM_031435). Accordingly, utilities of VGAM41 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP564I0422. Echinoderm Microtubule Associated Protein Like 4 (EML4, Accession NM_019063) is another VGAM41 host target gene. EML4 BINDING SITE is HOST

TARGET binding site found in the 3` untranslated region of mRNA encoded by EML4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EML4 BINDING SITE, designated SEQ ID:1876, to the nucleotide sequence of VGAM41 RNA, herein designated VGAM RNA, also designated SEQ ID:376.

[0921] Another function of VGAM41 is therefore inhibition of Echinoderm Microtubule Associated Protein Like 4 (EML4, Accession NM_019063). Accordingly, utilities of VGAM41 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EML4. FLJ21657 (Accession NM_022483) is another VGAM41 host target gene. FLJ21657 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ21657, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21657 BINDING SITE, designated SEQ ID:1990, to the nucleotide sequence of VGAM41 RNA, herein designated VGAM RNA, also designated SEQ ID:376.

[0922] Another function of VGAM41 is therefore inhibition of FLJ21657 (Accession NM_022483). Accordingly, utilities of VGAM41 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21657. KIAA1054 (Accession XM_043493) is another VGAM41 host target gene. KIAA1054 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1054, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1054 BINDING SITE, designated SEQ ID:2820, to the nucleotide sequence of VGAM41 RNA, herein designated VGAM RNA, also designated SEQ ID:376.

[0923] Another function of VGAM41 is therefore inhibition of KIAA1054 (Accession XM_043493). Accordingly, utilities of VGAM41 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1054. Sema Domain, Immunoglobulin Domain (Ig), Short Basic Domain, Secreted, (semaphorin) 3E (SEMA3E, Accession NM_012431) is another VGAM41 host target gene. SEMA3E BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by

SEMA3E, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SEMA3E BINDING SITE, designated SEQ ID:1431, to the nucleotide sequence of VGAM41 RNA, herein designated VGAM RNA, also designated SEQ ID:376.

[0924] Another function of VGAM41 is therefore inhibition of Sema Domain, Immunoglobulin Domain (Ig), Short Basic Domain, Secreted, (semaphorin) 3E (SEMA3E, Accession NM_012431). Accordingly, utilities of VGAM41 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SEMA3E. LOC130507 (Accession XM_059440) is another VGAM41 host target gene. LOC130507 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC130507, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC130507 BINDING SITE, designated SEQ ID:3011, to the nucleotide sequence of VGAM41 RNA, herein designated VGAM RNA, also designated SEQ ID:376.

[0925] Another function of VGAM41 is therefore inhibition of LOC130507 (Accession XM_059440). Accordingly, utilities of VGAM41 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC130507. LOC148145 (Accession XM_097410) is another VGAM41 host target gene. LOC148145 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC148145, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148145 BINDING SITE, designated SEQ ID:3296, to the nucleotide sequence of VGAM41 RNA, herein designated VGAM RNA, also designated SEQ ID:376.

[0926] Another function of VGAM41 is therefore inhibition of LOC148145 (Accession XM_097410). Accordingly, utilities of VGAM41 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148145. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 42 (VGAM42) viral gene, which modulates expression of respective host target genes thereof,

the function and utility of which host target genes is known in the art.

[0927] VGAM42 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM42 was detected is described hereinabove with reference to Figs. 1–8.

[0928] VGAM42 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus. VGAM42 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[0929] VGAM42 gene encodes a VGAM42 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM42 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM42 precursor RNA is designated SEQ ID:28, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:28 is located at position 963 relative to the genome of Vaccinia Virus.

[0930] VGAM42 precursor RNA folds onto itself, forming VGAM42 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[0931] An enzyme complex designated DICER COMPLEX, `dices` the VGAM42 folded precursor RNA into VGAM42 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 92%) nucleotide sequence of VGAM42 RNA is designated SEQ ID:377, and is provided hereinbelow with reference to the sequence listing part.

[0932] VGAM42 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM42 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM42 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3`

untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[0933] VGAM42 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM42 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM42 RNA is an accurate or a partial inverted-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM42 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM42 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[0934] The complementary binding of VGAM42 RNA, herein designated VGAM RNA, to host target binding sites on VGAM42 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM42 host target RNA into VGAM42 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[0935] It is appreciated that VGAM42 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM42 host target genes. The mRNA of each one of this plurality of VGAM42 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM42 RNA, herein designated VGAM RNA, and which when bound by VGAM42 RNA causes inhibition of translation of respective one or more VGAM42 host target proteins.

[0936] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM42 gene, herein designated VGAM GENE, on one or more VGAM42 host target gene, herein designated VGAM

HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[0937] It is yet further appreciated that a function of VGAM42 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM42 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM42 correlate with, and may be deduced from, the identity of the host target genes which VGAM42 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[0938] Nucleotide sequences of the VGAM42 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

`diced` VGAM42 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM42 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM42 are further described hereinbelow with reference to Table 1.

[0939] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM42 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM42 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[0940] As mentioned hereinabove with reference to Fig. 1, a function of VGAM42 gene, herein designated VGAM is inhibition of expression of VGAM42 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM42 correlate with, and may be deduced from, the identity of the target genes which VGAM42 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[0941] Dickkopf Homolog 1 (*Xenopus laevis*) (DKK1, Accession NM_012242) is a VGAM42 host target gene. DKK1 BINDING SITE is HOST TARGET binding site found in the 3' un-

translated region of mRNA encoded by DKK1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKK1 BINDING SITE, designated SEQ ID:1417, to the nucleotide sequence of VGAM42 RNA, herein designated VGAM RNA, also designated SEQ ID:377.

[0942] A function of VGAM42 is therefore inhibition of Dickkopf Homolog 1 (*Xenopus laevis*) (DKK1, Accession NM_012242), a gene which is a growth factor and inhibits Wnt signaling. Accordingly, utilities of VGAM42 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKK1. The function of DKK1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM39. Keratocan (KERA, Accession NM_007035) is another VGAM42 host target gene. KERA BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KERA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KERA BIND-

ING SITE, designated SEQ ID:1349, to the nucleotide sequence of VGAM42 RNA, herein designated VGAM RNA, also designated SEQ ID:377.

[0943] Another function of VGAM42 is therefore inhibition of Keratocan (KERA, Accession NM_007035), a gene which may be important in developing and maintaining corneal transparency and for the structure of the stromal matrix. Accordingly, utilities of VGAM42 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KERA. The function of KERA and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM39. Protein Phosphatase 1, Regulatory (inhibitor) Subunit 12A (PPP1R12A, Accession NM_002480) is another VGAM42 host target gene. PPP1R12A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PPP1R12A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PPP1R12A BINDING SITE, designated SEQ ID:931, to the nucleotide sequence of VGAM42 RNA, herein designated VGAM RNA, also designated SEQ

ID:377.

[0944] Another function of VGAM42 is therefore inhibition of Protein Phosphatase 1, Regulatory (inhibitor) Subunit 12A (PPP1R12A, Accession NM_002480), a gene which regulates the interaction of actin and myosin. Accordingly, utilities of VGAM42 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPP1R12A. The function of PPP1R12A and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM39. S100 Calcium Binding Protein, Beta (neural) (S100B, Accession NM_006272) is another VGAM42 host target gene. S100B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by S100B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of S100B BINDING SITE, designated SEQ ID:1284, to the nucleotide sequence of VGAM42 RNA, herein designated VGAM RNA, also designated SEQ ID:377.

[0945] Another function of VGAM42 is therefore inhibition of S100 Calcium Binding Protein, Beta (neural) (S100B, Ac-

cession NM_006272), a gene which weakly binds calcium but binds zinc very tightly—distinct binding sites with different affinities exist for both ions on each monomer. Accordingly, utilities of VGAM42 include diagnosis, prevention and treatment of diseases and clinical conditions associated with S100B. The function of S100B and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM39.DKFZP564I0422

(Accession NM_031435) is another VGAM42 host target gene. DKFZP564I0422 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP564I0422, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP564I0422 BINDING SITE, designated SEQ ID:2196, to the nucleotide sequence of VGAM42 RNA, herein designated VGAM RNA, also designated SEQ ID:377.

[0946] Another function of VGAM42 is therefore inhibition of DKFZP564I0422 (Accession NM_031435). Accordingly, utilities of VGAM42 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

DKFZP564I0422. Echinoderm Microtubule Associated Protein Like 4 (EML4, Accession NM_019063) is another VGAM42 host target gene. EML4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by EML4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EML4 BINDING SITE, designated SEQ ID:1876, to the nucleotide sequence of VGAM42 RNA, herein designated VGAM RNA, also designated SEQ ID:377.

[0947] Another function of VGAM42 is therefore inhibition of Echinoderm Microtubule Associated Protein Like 4 (EML4, Accession NM_019063). Accordingly, utilities of VGAM42 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EML4. FLJ21657 (Accession NM_022483) is another VGAM42 host target gene. FLJ21657 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ21657, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21657 BINDING SITE, designated

SEQ ID:1990, to the nucleotide sequence of VGAM42 RNA, herein designated VGAM RNA, also designated SEQ ID:377.

[0948] Another function of VGAM42 is therefore inhibition of FLJ21657 (Accession NM_022483). Accordingly, utilities of VGAM42 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21657. KIAA1054 (Accession XM_043493) is another VGAM42 host target gene. KIAA1054 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1054, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1054 BINDING SITE, designated SEQ ID:2820, to the nucleotide sequence of VGAM42 RNA, herein designated VGAM RNA, also designated SEQ ID:377.

[0949] Another function of VGAM42 is therefore inhibition of KIAA1054 (Accession XM_043493). Accordingly, utilities of VGAM42 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1054. Sema Domain, Immunoglobulin Domain (Ig), Short Basic Domain, Secreted, (semaphorin) 3E (SEMA3E,

Accession NM_012431) is another VGAM42 host target gene. SEMA3E BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by SEMA3E, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SEMA3E BINDING SITE, designated SEQ ID:1431, to the nucleotide sequence of VGAM42 RNA, herein designated VGAM RNA, also designated SEQ ID:377.

[0950] Another function of VGAM42 is therefore inhibition of Sema Domain, Immunoglobulin Domain (Ig), Short Basic Domain, Secreted, (semaphorin) 3E (SEMA3E, Accession NM_012431). Accordingly, utilities of VGAM42 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SEMA3E. LOC130507 (Accession XM_059440) is another VGAM42 host target gene. LOC130507 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC130507, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC130507 BINDING SITE, desig-

nated SEQ ID:3011, to the nucleotide sequence of VGAM42 RNA, herein designated VGAM RNA, also designated SEQ ID:377.

[0951] Another function of VGAM42 is therefore inhibition of LOC130507 (Accession XM_059440). Accordingly, utilities of VGAM42 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC130507. LOC148145 (Accession XM_097410) is another VGAM42 host target gene. LOC148145 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC148145, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148145 BINDING SITE, designated SEQ ID:3296, to the nucleotide sequence of VGAM42 RNA, herein designated VGAM RNA, also designated SEQ ID:377.

[0952] Another function of VGAM42 is therefore inhibition of LOC148145 (Accession XM_097410). Accordingly, utilities of VGAM42 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148145. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the

present invention, referred to here as Viral Genomic Address Messenger 43 (VGAM43) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[0953] VGAM43 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM43 was detected is described hereinabove with reference to Figs. 1–8.

[0954] VGAM43 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus. VGAM43 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[0955] VGAM43 gene encodes a VGAM43 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM43 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM43 precursor RNA is designated SEQ ID:29, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:29 is located at position 963 relative to the genome of Vaccinia Virus.

[0956] VGAM43 precursor RNA folds onto itself, forming VGAM43 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[0957] An enzyme complex designated DICER COMPLEX, `dices` the VGAM43 folded precursor RNA into VGAM43 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 92%) nucleotide sequence of VGAM43 RNA is designated SEQ ID:378, and is provided hereinbelow with reference to the sequence listing part.

[0958] VGAM43 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM43 host target RNA, herein designated VGAM HOST

TARGET RNA. VGAM43 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[0959] VGAM43 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM43 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM43 RNA is an accurate or a partial inverted-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM43 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM43 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region,

this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[0960] The complementary binding of VGAM43 RNA, herein designated VGAM RNA, to host target binding sites on VGAM43 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM43 host target RNA into VGAM43 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[0961] It is appreciated that VGAM43 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM43 host target genes. The mRNA of each one of this plurality of VGAM43 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM43 RNA, herein designated VGAM RNA, and which when bound by VGAM43 RNA causes inhibition of translation of respective one or more VGAM43 host target proteins.

[0962] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM43 gene, herein designated VGAM GENE, on one or more VGAM43 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[0963] It is yet further appreciated that a function of VGAM43 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM43 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM43 correlate with, and may be deduced from, the identity of the host target genes which VGAM43 binds and inhibits, and the function of these host target genes, as elaborated herein—

below.

[0964] Nucleotide sequences of the VGAM43 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM43 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM43 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM43 are further described hereinbelow with reference to Table 1.

[0965] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM43 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM43 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[0966] As mentioned hereinabove with reference to Fig. 1, a function of VGAM43 gene, herein designated VGAM is inhibition of expression of VGAM43 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM43 correlate with, and may be deduced from, the identity of the target genes which VGAM43 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[0967] Dickkopf Homolog 1 (*Xenopus laevis*) (DKK1, Accession NM_012242) is a VGAM43 host target gene. DKK1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKK1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKK1 BINDING SITE, designated SEQ ID:1417, to the nucleotide sequence of VGAM43 RNA, herein designated VGAM RNA, also designated SEQ ID:378.

[0968] A function of VGAM43 is therefore inhibition of Dickkopf Homolog 1 (*Xenopus laevis*) (DKK1, Accession NM_012242), a gene which is a growth factor and inhibits Wnt signaling. Accordingly, utilities of VGAM43 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKK1. The function of DKK1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM39. Keratocan (KERA, Accession NM_007035) is another VGAM43 host target gene. KERA BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KERA, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KERA BINDING SITE, designated SEQ ID:1349, to the nucleotide sequence of VGAM43 RNA, herein designated VGAM RNA, also designated SEQ ID:378.

[0969] Another function of VGAM43 is therefore inhibition of Keratocan (KERA, Accession NM_007035), a gene which may be important in developing and maintaining corneal transparency and for the structure of the stromal matrix. Accordingly, utilities of VGAM43 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KERA. The function of KERA and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM39. Protein Phosphatase 1, Regulatory (inhibitor) Subunit 12A (PPP1R12A, Accession NM_002480) is another VGAM43 host target gene. PPP1R12A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PPP1R12A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of PPP1R12A BINDING SITE, designated SEQ ID:931, to the nucleotide sequence of VGAM43 RNA, herein designated VGAM RNA, also designated SEQ ID:378.

[0970] Another function of VGAM43 is therefore inhibition of Protein Phosphatase 1, Regulatory (inhibitor) Subunit 12A (PPP1R12A, Accession NM_002480), a gene which regulates the interaction of actin and myosin. Accordingly, utilities of VGAM43 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPP1R12A. The function of PPP1R12A and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM39.S100 Calcium Binding Protein, Beta (neural) (S100B, Accession NM_006272) is another VGAM43 host target gene. S100B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by S100B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of S100B BINDING SITE, designated SEQ ID:1284, to the nucleotide sequence of VGAM43 RNA, herein designated VGAM RNA,

also designated SEQ ID:378.

[0971] Another function of VGAM43 is therefore inhibition of S100 Calcium Binding Protein, Beta (neural) (S100B, Accession NM_006272), a gene which weakly binds calcium but binds zinc very tightly—distinct binding sites with different affinities exist for both ions on each monomer. Accordingly, utilities of VGAM43 include diagnosis, prevention and treatment of diseases and clinical conditions associated with S100B. The function of S100B and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM39.DKFZP564I0422 (Accession NM_031435) is another VGAM43 host target gene. DKFZP564I0422 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP564I0422, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP564I0422 BINDING SITE, designated SEQ ID:2196, to the nucleotide sequence of VGAM43 RNA, herein designated VGAM RNA, also designated SEQ ID:378.

[0972] Another function of VGAM43 is therefore inhibition of DK—

FZP564I0422 (Accession NM_031435). Accordingly, utilities of VGAM43 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP564I0422. Echinoderm Microtubule Associated Protein Like 4 (EML4, Accession NM_019063) is another VGAM43 host target gene. EML4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EML4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EML4 BINDING SITE, designated SEQ ID:1876, to the nucleotide sequence of VGAM43 RNA, herein designated VGAM RNA, also designated SEQ ID:378.

[0973] Another function of VGAM43 is therefore inhibition of Echinoderm Microtubule Associated Protein Like 4 (EML4, Accession NM_019063). Accordingly, utilities of VGAM43 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EML4. FLJ21657 (Accession NM_022483) is another VGAM43 host target gene. FLJ21657 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ21657, corresponding to a HOST TARGET binding

site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21657 BINDING SITE, designated SEQ ID:1990, to the nucleotide sequence of VGAM43 RNA, herein designated VGAM RNA, also designated SEQ ID:378.

[0974] Another function of VGAM43 is therefore inhibition of FLJ21657 (Accession NM_022483). Accordingly, utilities of VGAM43 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21657. KIAA1054 (Accession XM_043493) is another VGAM43 host target gene. KIAA1054 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1054, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1054 BINDING SITE, designated SEQ ID:2820, to the nucleotide sequence of VGAM43 RNA, herein designated VGAM RNA, also designated SEQ ID:378.

[0975] Another function of VGAM43 is therefore inhibition of KIAA1054 (Accession XM_043493). Accordingly, utilities of VGAM43 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with KIAA1054. Sema Domain, Immunoglobulin Domain (Ig), Short Basic Domain, Secreted, (semaphorin) 3E (SEMA3E, Accession NM_012431) is another VGAM43 host target gene. SEMA3E BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by SEMA3E, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SEMA3E BINDING SITE, designated SEQ ID:1431, to the nucleotide sequence of VGAM43 RNA, herein designated VGAM RNA, also designated SEQ ID:378.

[0976] Another function of VGAM43 is therefore inhibition of Sema Domain, Immunoglobulin Domain (Ig), Short Basic Domain, Secreted, (semaphorin) 3E (SEMA3E, Accession NM_012431). Accordingly, utilities of VGAM43 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SEMA3E. LOC130507 (Accession XM_059440) is another VGAM43 host target gene. LOC130507 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC130507, corresponding to a HOST TARGET binding

site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC130507 BINDING SITE, designated SEQ ID:3011, to the nucleotide sequence of VGAM43 RNA, herein designated VGAM RNA, also designated SEQ ID:378.

[0977] Another function of VGAM43 is therefore inhibition of LOC130507 (Accession XM_059440). Accordingly, utilities of VGAM43 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC130507. LOC148145 (Accession XM_097410) is another VGAM43 host target gene. LOC148145 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC148145, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148145 BINDING SITE, designated SEQ ID:3296, to the nucleotide sequence of VGAM43 RNA, herein designated VGAM RNA, also designated SEQ ID:378.

[0978] Another function of VGAM43 is therefore inhibition of LOC148145 (Accession XM_097410). Accordingly, utilities of VGAM43 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LOC148145. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 44 (VGAM44) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[0979] VGAM44 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM44 was detected is described hereinabove with reference to Figs. 1–8.

[0980] VGAM44 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus. VGAM44 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[0981] VGAM44 gene encodes a VGAM44 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM44 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM44 precursor RNA is designated SEQ ID:30, and is provided hereinbelow with reference to the

sequence listing part. Nucleotide sequence SEQ ID:30 is located at position 963 relative to the genome of Vaccinia Virus.

[0982] VGAM44 precursor RNA folds onto itself, forming VGAM44 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[0983] An enzyme complex designated DICER COMPLEX, `dices` the VGAM44 folded precursor RNA into VGAM44 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 92%) nucleotide sequence of VGAM44 RNA is designated SEQ ID:379, and is provided hereinbelow with reference to the sequence listing part.

[0984] VGAM44 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM44 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM44 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[0985] VGAM44 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM44 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM44 RNA is an accurate or a partial inverted-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM44 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of

a VGAM44 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR and 5' UTR regions.

[0986] The complementary binding of VGAM44 RNA, herein designated VGAM RNA, to host target binding sites on VGAM44 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM44 host target RNA into VGAM44 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[0987] It is appreciated that VGAM44 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM44 host target genes. The mRNA of each one of this plurality of VGAM44 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM44 RNA, herein designated VGAM RNA, and which when bound by VGAM44 RNA causes inhibition of translation of respective one or more VGAM44

host target proteins.

[0988] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM44 gene, herein designated VGAM GENE, on one or more VGAM44 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[0989] It is yet further appreciated that a function of VGAM44 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM44 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM44 correlate

with, and may be deduced from, the identity of the host target genes which VGAM44 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[0990] Nucleotide sequences of the VGAM44 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM44 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM44 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM44 are further described hereinbelow with reference to Table 1.

[0991] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM44 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM44 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[0992] As mentioned hereinabove with reference to Fig. 1, a function of VGAM44 gene, herein designated VGAM is inhibition of expression of VGAM44 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM44 correlate with, and may be deduced from, the

identity of the target genes which VGAM44 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[0993] Dickkopf Homolog 1 (*Xenopus laevis*) (DKK1, Accession NM_012242) is a VGAM44 host target gene. DKK1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKK1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKK1 BINDING SITE, designated SEQ ID:1417, to the nucleotide sequence of VGAM44 RNA, herein designated VGAM RNA, also designated SEQ ID:379.

[0994] A function of VGAM44 is therefore inhibition of Dickkopf Homolog 1 (*Xenopus laevis*) (DKK1, Accession NM_012242), a gene which is a growth factor and inhibits Wnt signaling. Accordingly, utilities of VGAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKK1. The function of DKK1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM39. Keratocan (KERA, Accession NM_007035) is an-

other VGAM44 host target gene. KERA BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KERA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KERA BINDING SITE, designated SEQ ID:1349, to the nucleotide sequence of VGAM44 RNA, herein designated VGAM RNA, also designated SEQ ID:379.

[0995] Another function of VGAM44 is therefore inhibition of Keratocan (KERA, Accession NM_007035), a gene which may be important in developing and maintaining corneal transparency and for the structure of the stromal matrix. Accordingly, utilities of VGAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KERA. The function of KERA and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM39. Protein Phosphatase 1, Regulatory (inhibitor) Subunit 12A (PPP1R12A, Accession NM_002480) is another VGAM44 host target gene. PPP1R12A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by

PPP1R12A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PPP1R12A BINDING SITE, designated SEQ ID:931, to the nucleotide sequence of VGAM44 RNA, herein designated VGAM RNA, also designated SEQ ID:379.

[0996] Another function of VGAM44 is therefore inhibition of Protein Phosphatase 1, Regulatory (inhibitor) Subunit 12A (PPP1R12A, Accession NM_002480), a gene which regulates the interaction of actin and myosin. Accordingly, utilities of VGAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPP1R12A. The function of PPP1R12A and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM39.S100 Calcium Binding Protein, Beta (neural) (S100B, Accession NM_006272) is another VGAM44 host target gene. S100B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by S100B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of S100B BINDING SITE, designated SEQ ID:1284, to the nucleotide sequence of VGAM44 RNA, herein designated VGAM RNA, also designated SEQ ID:379.

[0997] Another function of VGAM44 is therefore inhibition of S100 Calcium Binding Protein, Beta (neural) (S100B, Accession NM_006272), a gene which weakly binds calcium but binds zinc very tightly—distinct binding sites with different affinities exist for both ions on each monomer. Accordingly, utilities of VGAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with S100B. The function of S100B and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM39.DKFZP564I0422 (Accession NM_031435) is another VGAM44 host target gene. DKFZP564I0422 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP564I0422, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP564I0422 BINDING SITE, designated SEQ ID:2196, to the nucleotide

sequence of VGAM44 RNA, herein designated VGAM RNA, also designated SEQ ID:379.

[0998] Another function of VGAM44 is therefore inhibition of DKFZP564I0422 (Accession NM_031435). Accordingly, utilities of VGAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP564I0422. Echinoderm Microtubule Associated Protein Like 4 (EML4, Accession NM_019063) is another VGAM44 host target gene. EML4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EML4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EML4 BINDING SITE, designated SEQ ID:1876, to the nucleotide sequence of VGAM44 RNA, herein designated VGAM RNA, also designated SEQ ID:379.

[0999] Another function of VGAM44 is therefore inhibition of Echinoderm Microtubule Associated Protein Like 4 (EML4, Accession NM_019063). Accordingly, utilities of VGAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EML4. FLJ21657 (Accession NM_022483) is another VGAM44 host target

gene. FLJ21657 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ21657, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21657 BINDING SITE, designated SEQ ID:1990, to the nucleotide sequence of VGAM44 RNA, herein designated VGAM RNA, also designated SEQ ID:379.

[1000] Another function of VGAM44 is therefore inhibition of FLJ21657 (Accession NM_022483). Accordingly, utilities of VGAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21657. KIAA1054 (Accession XM_043493) is another VGAM44 host target gene. KIAA1054 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1054, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1054 BINDING SITE, designated SEQ ID:2820, to the nucleotide sequence of VGAM44 RNA, herein designated VGAM RNA, also designated SEQ ID:379.

[1001] Another function of VGAM44 is therefore inhibition of KIAA1054 (Accession XM_043493). Accordingly, utilities of VGAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1054. Sema Domain, Immunoglobulin Domain (Ig), Short Basic Domain, Secreted, (semaphorin) 3E (SEMA3E, Accession NM_012431) is another VGAM44 host target gene. SEMA3E BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by SEMA3E, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SEMA3E BINDING SITE, designated SEQ ID:1431, to the nucleotide sequence of VGAM44 RNA, herein designated VGAM RNA, also designated SEQ ID:379.

[1002] Another function of VGAM44 is therefore inhibition of Sema Domain, Immunoglobulin Domain (Ig), Short Basic Domain, Secreted, (semaphorin) 3E (SEMA3E, Accession NM_012431). Accordingly, utilities of VGAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SEMA3E. LOC130507 (Accession XM_059440) is another VGAM44 host target

gene. LOC130507 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC130507, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC130507 BINDING SITE, designated SEQ ID:3011, to the nucleotide sequence of VGAM44 RNA, herein designated VGAM RNA, also designated SEQ ID:379.

[1003] Another function of VGAM44 is therefore inhibition of LOC130507 (Accession XM_059440). Accordingly, utilities of VGAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC130507. LOC148145 (Accession XM_097410) is another VGAM44 host target gene. LOC148145 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC148145, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148145 BINDING SITE, designated SEQ ID:3296, to the nucleotide sequence of VGAM44 RNA, herein designated VGAM RNA, also designated SEQ ID:379.

[1004] Another function of VGAM44 is therefore inhibition of LOC148145 (Accession XM_097410). Accordingly, utilities of VGAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148145. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 45 (VGAM45) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[1005] VGAM45 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM45 was detected is described hereinabove with reference to Figs. 1–8.

[1006] VGAM45 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus. VGAM45 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[1007] VGAM45 gene encodes a VGAM45 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM45 precursor RNA does not encode a protein. A nucleotide

sequence identical or highly similar to the nucleotide sequence of VGAM45 precursor RNA is designated SEQ ID:31, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:31 is located at position 2576 relative to the genome of Vaccinia Virus.

[1008] VGAM45 precursor RNA folds onto itself, forming VGAM45 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[1009] An enzyme complex designated DICER COMPLEX, `dices` the VGAM45 folded precursor RNA into VGAM45 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 92%) nucleotide se-

quence of VGAM45 RNA is designated SEQ ID:380, and is provided hereinbelow with reference to the sequence listing part.

[1010] VGAM45 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM45 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM45 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[1011] VGAM45 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM45 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM45 RNA is an accurate or a partial inverted-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustrat-

tion only, and is not meant to be limiting – VGAM45 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM45 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[1012] The complementary binding of VGAM45 RNA, herein designated VGAM RNA, to host target binding sites on VGAM45 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM45 host target RNA into VGAM45 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[1013] It is appreciated that VGAM45 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM45 host target genes. The mRNA of each one of this plurality of VGAM45 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM45 RNA, herein designated VGAM RNA, and which when bound by VGAM45 RNA causes inhibition of translation of respective one or more VGAM45 host target proteins.

- [1014] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM45 gene, herein designated VGAM GENE, on one or more VGAM45 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).
- [1015] It is yet further appreciated that a function of VGAM45 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM45 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM45 correlate with, and may be deduced from, the identity of the host target genes which VGAM45 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[1016] Nucleotide sequences of the VGAM45 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM45 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM45 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM45 are further described hereinbelow with reference to Table 1.

[1017] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM45 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM45 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[1018] As mentioned hereinabove with reference to Fig. 1, a function of VGAM45 gene, herein designated VGAM is in-

hibition of expression of VGAM45 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM45 correlate with, and may be deduced from, the identity of the target genes which VGAM45 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[1019] Dickkopf Homolog 1 (*Xenopus laevis*) (DKK1, Accession NM_012242) is a VGAM45 host target gene. DKK1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKK1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKK1 BINDING SITE, designated SEQ ID:1417, to the nucleotide sequence of VGAM45 RNA, herein designated VGAM RNA, also designated SEQ ID:380.

[1020] A function of VGAM45 is therefore inhibition of Dickkopf Homolog 1 (*Xenopus laevis*) (DKK1, Accession NM_012242), a gene which is a growth factor and inhibits Wnt signaling. Accordingly, utilities of VGAM45 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKK1. The function of DKK1 and its association with various diseases and clinical

conditions, has been established by previous studies, as described hereinabove with reference to VGAM39. Keratocan (KERA, Accession NM_007035) is another VGAM45 host target gene. KERA BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KERA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KERA BINDING SITE, designated SEQ ID:1349, to the nucleotide sequence of VGAM45 RNA, herein designated VGAM RNA, also designated SEQ ID:380.

[1021] Another function of VGAM45 is therefore inhibition of Keratocan (KERA, Accession NM_007035), a gene which may be important in developing and maintaining corneal transparency and for the structure of the stromal matrix. Accordingly, utilities of VGAM45 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KERA. The function of KERA and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM39. Protein Phosphatase 1, Regulatory (inhibitor) Subunit 12A (PPP1R12A, Accession

NM_002480) is another VGAM45 host target gene.

PPP1R12A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PPP1R12A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PPP1R12A BINDING SITE, designated SEQ ID:931, to the nucleotide sequence of VGAM45 RNA, herein designated VGAM RNA, also designated SEQ ID:380.

[1022] Another function of VGAM45 is therefore inhibition of Protein Phosphatase 1, Regulatory (inhibitor) Subunit 12A (PPP1R12A, Accession NM_002480), a gene which regulates the interaction of actin and myosin. Accordingly, utilities of VGAM45 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPP1R12A. The function of PPP1R12A and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM39.S100 Calcium Binding Protein, Beta (neural) (S100B, Accession NM_006272) is another VGAM45 host target gene. S100B BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by S100B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of S100B BINDING SITE, designated SEQ ID:1284, to the nucleotide sequence of VGAM45 RNA, herein designated VGAM RNA, also designated SEQ ID:380.

[1023] Another function of VGAM45 is therefore inhibition of S100 Calcium Binding Protein, Beta (neural) (S100B, Accession NM_006272), a gene which weakly binds calcium but binds zinc very tightly—distinct binding sites with different affinities exist for both ions on each monomer. Accordingly, utilities of VGAM45 include diagnosis, prevention and treatment of diseases and clinical conditions associated with S100B. The function of S100B and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM39.DKFZP564I0422 (Accession NM_031435) is another VGAM45 host target gene. DKFZP564I0422 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP564I0422, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE

II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP564I0422 BINDING SITE, designated SEQ ID:2196, to the nucleotide sequence of VGAM45 RNA, herein designated VGAM RNA, also designated SEQ ID:380.

[1024] Another function of VGAM45 is therefore inhibition of DKFZP564I0422 (Accession NM_031435). Accordingly, utilities of VGAM45 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP564I0422. Echinoderm Microtubule Associated Protein Like 4 (EML4, Accession NM_019063) is another VGAM45 host target gene. EML4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EML4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EML4 BINDING SITE, designated SEQ ID:1876, to the nucleotide sequence of VGAM45 RNA, herein designated VGAM RNA, also designated SEQ ID:380.

[1025] Another function of VGAM45 is therefore inhibition of Echinoderm Microtubule Associated Protein Like 4 (EML4, Accession NM_019063). Accordingly, utilities of VGAM45

include diagnosis, prevention and treatment of diseases and clinical conditions associated with EML4. FLJ21657 (Accession NM_022483) is another VGAM45 host target gene. FLJ21657 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ21657, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21657 BINDING SITE, designated SEQ ID:1990, to the nucleotide sequence of VGAM45 RNA, herein designated VGAM RNA, also designated SEQ ID:380.

[1026] Another function of VGAM45 is therefore inhibition of FLJ21657 (Accession NM_022483). Accordingly, utilities of VGAM45 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21657. KIAA1054 (Accession XM_043493) is another VGAM45 host target gene. KIAA1054 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1054, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1054 BINDING SITE,

designated SEQ ID:2820, to the nucleotide sequence of VGAM45 RNA, herein designated VGAM RNA, also designated SEQ ID:380.

[1027] Another function of VGAM45 is therefore inhibition of KIAA1054 (Accession XM_043493). Accordingly, utilities of VGAM45 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1054. Sema Domain, Immunoglobulin Domain (Ig), Short Basic Domain, Secreted, (semaphorin) 3E (SEMA3E, Accession NM_012431) is another VGAM45 host target gene. SEMA3E BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by SEMA3E, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SEMA3E BINDING SITE, designated SEQ ID:1431, to the nucleotide sequence of VGAM45 RNA, herein designated VGAM RNA, also designated SEQ ID:380.

[1028] Another function of VGAM45 is therefore inhibition of Sema Domain, Immunoglobulin Domain (Ig), Short Basic Domain, Secreted, (semaphorin) 3E (SEMA3E, Accession NM_012431). Accordingly, utilities of VGAM45 include di-

agnosis, prevention and treatment of diseases and clinical conditions associated with SEMA3E. LOC130507

(Accession XM_059440) is another VGAM45 host target gene. LOC130507 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC130507, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC130507 BINDING SITE, designated SEQ ID:3011, to the nucleotide sequence of VGAM45 RNA, herein designated VGAM RNA, also designated SEQ ID:380.

[1029] Another function of VGAM45 is therefore inhibition of LOC130507 (Accession XM_059440). Accordingly, utilities of VGAM45 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC130507. LOC148145 (Accession XM_097410) is another VGAM45 host target gene. LOC148145 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC148145, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC148145 BINDING SITE, designated SEQ ID:3296, to the nucleotide sequence of VGAM45 RNA, herein designated VGAM RNA, also designated SEQ ID:380.

[1030] Another function of VGAM45 is therefore inhibition of LOC148145 (Accession XM_097410). Accordingly, utilities of VGAM45 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148145. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 46 (VGAM46) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[1031] VGAM46 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM46 was detected is described hereinabove with reference to Figs. 1–8.

[1032] VGAM46 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus. VGAM46 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[1033] VGAM46 gene encodes a VGAM46 precursor RNA, herein

designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM46 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM46 precursor RNA is designated SEQ ID:32, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:32 is located at position 4213 relative to the genome of Vaccinia Virus.

[1034] VGAM46 precursor RNA folds onto itself, forming VGAM46 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[1035] An enzyme complex designated DICER COMPLEX, `dices` the VGAM46 folded precursor RNA into VGAM46 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 92%) nucleotide sequence of VGAM46 RNA is designated SEQ ID:381, and is provided hereinbelow with reference to the sequence listing part.

[1036] VGAM46 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM46 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM46 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[1037] VGAM46 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM46 host target RNA, herein designated VGAM HOST TARGET RNA. This com-

plementary binding is due to the fact that the nucleotide sequence of VGAM46 RNA is an accurate or a partial inverted-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM46 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM46 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[1038] The complementary binding of VGAM46 RNA, herein designated VGAM RNA, to host target binding sites on VGAM46 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM46 host target RNA into VGAM46 host target protein, herein desig-

nated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[1039] It is appreciated that VGAM46 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM46 host target genes. The mRNA of each one of this plurality of VGAM46 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM46 RNA, herein designated VGAM RNA, and which when bound by VGAM46 RNA causes inhibition of translation of respective one or more VGAM46 host target proteins.

[1040] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM46 gene, herein designated VGAM GENE, on one or more VGAM46 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also

believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[1041] It is yet further appreciated that a function of VGAM46 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM46 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM46 correlate with, and may be deduced from, the identity of the host target genes which VGAM46 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[1042] Nucleotide sequences of the VGAM46 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM46 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM46 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM46 are further described hereinbelow with reference to Table 1.

[1043] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM46 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM46 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[1044] As mentioned hereinabove with reference to Fig. 1, a function of VGAM46 gene, herein designated VGAM is inhibition of expression of VGAM46 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM46 correlate with, and may be deduced from, the identity of the target genes which VGAM46 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[1045] EFG1 (Accession XM_170611) is a VGAM46 host target gene. EFG1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EFG1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EFG1 BINDING SITE, designated SEQ ID:3661, to the nucleotide sequence of VGAM46 RNA, herein designated VGAM RNA, also designated SEQ ID:381.

[1046] A function of VGAM46 is therefore inhibition of EFG1 (Accession XM_170611), a gene which promotes the gtp-dependent translocation of the nascent protein chain from the a-site to the p-site of the ribosome in the mitochondria. Accordingly, utilities of VGAM46 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EFG1. The function of EFG1 has been established by previous studies. By EST database searching with rat Efg as probe, followed by PCR of a testis cDNA library, Gao et al. (2001) obtained cDNAs encoding mouse and human EFG1, which they called GFM. EFG1 encodes a deduced 751-amino acid protein that shares 84% and 89% sequence identity with rat Efg and mouse Gfm, respectively, and contains a conserved GTP-binding elongation factor signature and a GTP-binding domain composed of 3 motifs. Northern blot analysis revealed wide expression of 3.8- and 3.4-kb transcripts, abundant in heart, skeletal muscle, and testis, as well as testis-specific expression of a 2.9-kb transcript. Independently, Hammarsund et al. (2001) identified and characterized mitochondrial elongation factor-2 (EFG2; 606544) and used information contained in public databases to identify and clone the complete coding sequence of the human EFG1 gene on chro-

mosome 3q25.

- [1047] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:
- [1048] Gao, J.; Yu, L.; Zhang, P.; Jiang, J.; Chen, J.; Peng, J.; Wei, Y.; Zhao, S. : Cloning and characterization of human and mouse mitochondrial elongation factor G, GFM and Gfm, and mapping of GFM to human chromosome 3q25.1–q26.2. *Genomics* 74: 109–114, 2001. ; and
- [1049] Hammarsund, M.; Wilson, W.; Corcoran, M.; Merup, M.; Einhorn, S.; Grander, D.; Sangfelt, O. : Identification and characterization of two novel human mitochondrial elongation factor gene.
- [1050] Further studies establishing the function and utilities of EFG1 are found in John Hopkins OMIM database record ID 606639, and in cited publications numbered 1414 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Phytanoyl–CoA Hydroxylase (Refsum disease) (PHYH, Accession NM_006214) is another VGAM46 host target gene. PHYH BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PHYH, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND–

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PHYH BINDING SITE, designated SEQ ID:1281, to the nucleotide sequence of VGAM46 RNA, herein designated VGAM RNA, also designated SEQ ID:381.

[1051] Another function of VGAM46 is therefore inhibition of Phytanoyl-CoA Hydroxylase (Refsum disease) (PHYH, Accession NM_006214). Accordingly, utilities of VGAM46 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PHYH. Solute Carrier Family 6 (neurotransmitter transporter, dopamine), Member 3 (SLC6A3, Accession NM_001044) is another VGAM46 host target gene. SLC6A3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC6A3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC6A3 BINDING SITE, designated SEQ ID:795, to the nucleotide sequence of VGAM46 RNA, herein designated VGAM RNA, also designated SEQ ID:381.

[1052] Another function of VGAM46 is therefore inhibition of Solute Carrier Family 6 (neurotransmitter transporter,

dopamine), Member 3 (SLC6A3, Accession NM_001044), a gene which terminates the action of dopamine by its high affinity sodium-dependent reuptake into presynaptic terminals. Accordingly, utilities of VGAM46 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC6A3. The function of SLC6A3 has been established by previous studies. Giros et al. (1996) found that the disruption of the mouse dopamine transporter gene results in spontaneous hyperlocomotion despite major adaptive changes such as decreases in neurotransmitter and receptor levels. In homozygous mice, dopamine persisted at least 100 times longer in the extracellular space, providing a biochemical explanation of the hyperdopaminergic phenotype and demonstrating the critical role of the transporter in regulating neurotransmission. The authors noted that the dopamine transporter is an obligatory target of cocaine and amphetamine, as demonstrated by the fact that these psychostimulants had no effect on locomotor activity or dopamine release and uptake in mice lacking the transporter. Giros et al. (1996) stated that the DAT knockout mice should be an excellent tool for the study and development of drugs used in the management of dopaminergic dysfunction. There are sim-

ilarities between the hyperdopaminergic phenotype of the knockout mice and some of the positive symptoms of schizophrenic patients. Specific blockade of the dopamine transporter with high-affinity inhibitors may be beneficial in illnesses such as Parkinson disease, where the effective levels of dopamine are markedly reduced.

[1053] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[1054] Gainetdinov, R. R.; Wetsel, W. C.; Jones, S. R.; Levin, E. D.; Jaber, M.; Caron, M. G. : Role of serotonin in the paradoxical calming effect of psychostimulants on hyperactivity. Science 283: 397–401, 1999. ; and

[1055] Giros, B.; Jaber, M.; Jones, S. R.; Wightman, R. M.; Caron, M. G. : Hyperlocomotion and indifference to cocaine and amphetamine in mice lacking the dopamine receptor. Nature 370: 606–612, 1992.

[1056] Further studies establishing the function and utilities of SLC6A3 are found in John Hopkins OMIM database record ID 126455, and in cited publications numbered 458–466, 20 and 517–523 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. H2AV (Accession NM_138635) is another VGAM46

host target gene. H2AV BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by H2AV, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of H2AV BINDING SITE, designated SEQ ID:2447, to the nucleotide sequence of VGAM46 RNA, herein designated VGAM RNA, also designated SEQ ID:381.

[1057] Another function of VGAM46 is therefore inhibition of H2AV (Accession NM_138635). Accordingly, utilities of VGAM46 include diagnosis, prevention and treatment of diseases and clinical conditions associated with H2AV. HMP19 (Accession XM_113455) is another VGAM46 host target gene. HMP19 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HMP19, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HMP19 BINDING SITE, designated SEQ ID:3408, to the nucleotide sequence of VGAM46 RNA, herein designated VGAM RNA, also designated SEQ ID:381.

[1058] Another function of VGAM46 is therefore inhibition of HMP19 (Accession XM_113455). Accordingly, utilities of VGAM46 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HMP19. KIAA1726 (Accession XM_040860) is another VGAM46 host target gene. KIAA1726 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1726, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1726 BINDING SITE, designated SEQ ID:2786, to the nucleotide sequence of VGAM46 RNA, herein designated VGAM RNA, also designated SEQ ID:381.

[1059] Another function of VGAM46 is therefore inhibition of KIAA1726 (Accession XM_040860). Accordingly, utilities of VGAM46 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1726. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 47 (VGAM47) viral gene, which modulates expression of respective host target genes thereof,

the function and utility of which host target genes is known in the art.

[1060] VGAM47 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM47 was detected is described hereinabove with reference to Figs. 1–8.

[1061] VGAM47 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus. VGAM47 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[1062] VGAM47 gene encodes a VGAM47 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM47 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM47 precursor RNA is designated SEQ ID:33, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:33 is located at position 3249 relative to the genome of Vaccinia Virus.

[1063] VGAM47 precursor RNA folds onto itself, forming VGAM47 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[1064] An enzyme complex designated DICER COMPLEX, `dices` the VGAM47 folded precursor RNA into VGAM47 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 76%) nucleotide sequence of VGAM47 RNA is designated SEQ ID:382, and is provided hereinbelow with reference to the sequence listing part.

[1065] VGAM47 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM47 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM47 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3`

untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[1066] VGAM47 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM47 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM47 RNA is an accurate or a partial inverted-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM47 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM47 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[1067] The complementary binding of VGAM47 RNA, herein designated VGAM RNA, to host target binding sites on VGAM47 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM47 host target RNA into VGAM47 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[1068] It is appreciated that VGAM47 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM47 host target genes. The mRNA of each one of this plurality of VGAM47 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM47 RNA, herein designated VGAM RNA, and which when bound by VGAM47 RNA causes inhibition of translation of respective one or more VGAM47 host target proteins.

[1069] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM47 gene, herein designated VGAM GENE, on one or more VGAM47 host target gene, herein designated VGAM

HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[1070] It is yet further appreciated that a function of VGAM47 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM47 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM47 correlate with, and may be deduced from, the identity of the host target genes which VGAM47 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[1071] Nucleotide sequences of the VGAM47 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

`diced` VGAM47 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM47 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM47 are further described hereinbelow with reference to Table 1.

[1072] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM47 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM47 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[1073] As mentioned hereinabove with reference to Fig. 1, a function of VGAM47 gene, herein designated VGAM is inhibition of expression of VGAM47 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM47 correlate with, and may be deduced from, the identity of the target genes which VGAM47 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[1074] SRY (sex determining region Y)-box 11 (SOX11, Accession NM_003108) is a VGAM47 host target gene. SOX11 BINDING SITE is HOST TARGET binding site found in the 3' un-

translated region of mRNA encoded by SOX11, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SOX11 BINDING SITE, designated SEQ ID:992, to the nucleotide sequence of VGAM47 RNA, herein designated VGAM RNA, also designated SEQ ID:382.

[1075] A function of VGAM47 is therefore inhibition of SRY (sex determining region Y)-box 11 (SOX11, Accession NM_003108). Accordingly, utilities of VGAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SOX11. CAP350 (Accession NM_014810) is another VGAM47 host target gene. CAP350 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CAP350, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CAP350 BINDING SITE, designated SEQ ID:1554, to the nucleotide sequence of VGAM47 RNA, herein designated VGAM RNA, also designated SEQ ID:382.

[1076] Another function of VGAM47 is therefore inhibition of

CAP350 (Accession NM_014810). Accordingly, utilities of VGAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CAP350. DKFZP564A022 (Accession NM_030954) is another VGAM47 host target gene. DKFZP564A022 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP564A022, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP564A022 BINDING SITE, designated SEQ ID:2174, to the nucleotide sequence of VGAM47 RNA, herein designated VGAM RNA, also designated SEQ ID:382.

[1077] Another function of VGAM47 is therefore inhibition of DKFZP564A022 (Accession NM_030954). Accordingly, utilities of VGAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP564A022. FLJ11730 (Accession NM_022756) is another VGAM47 host target gene. FLJ11730 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ11730, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of FLJ11730 BINDING SITE, designated SEQ ID:2005, to the nucleotide sequence of VGAM47 RNA, herein designated VGAM RNA, also designated SEQ ID:382.

[1078] Another function of VGAM47 is therefore inhibition of FLJ11730 (Accession NM_022756). Accordingly, utilities of VGAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11730. FLJ20686 (Accession NM_017925) is another VGAM47 host target gene. FLJ20686 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ20686, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20686 BINDING SITE, designated SEQ ID:1765, to the nucleotide sequence of VGAM47 RNA, herein designated VGAM RNA, also designated SEQ ID:382.

[1079] Another function of VGAM47 is therefore inhibition of FLJ20686 (Accession NM_017925). Accordingly, utilities of VGAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20686. FRSB (Accession NM_005687) is another VGAM47 host

target gene. FRSB BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FRSB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FRSB BINDING SITE, designated SEQ ID:1236, to the nucleotide sequence of VGAM47 RNA, herein designated VGAM RNA, also designated SEQ ID:382.

[1080] Another function of VGAM47 is therefore inhibition of FRSB (Accession NM_005687). Accordingly, utilities of VGAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FRSB. KIAA1600 (Accession XM_049351) is another VGAM47 host target gene. KIAA1600 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1600, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1600 BINDING SITE, designated SEQ ID:2919, to the nucleotide sequence of VGAM47 RNA, herein designated VGAM RNA, also designated SEQ ID:382.

[1081] Another function of VGAM47 is therefore inhibition of

KIAA1600 (Accession XM_049351). Accordingly, utilities of VGAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1600. LOC124801 (Accession XM_058850) is another VGAM47 host target gene. LOC124801 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC124801, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC124801 BINDING SITE, designated SEQ ID:2996, to the nucleotide sequence of VGAM47 RNA, herein designated VGAM RNA, also designated SEQ ID:382.

[1082] Another function of VGAM47 is therefore inhibition of LOC124801 (Accession XM_058850). Accordingly, utilities of VGAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC124801. LOC221035 (Accession XM_167640) is another VGAM47 host target gene. LOC221035 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221035, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC221035 BINDING SITE, designated SEQ ID:3593, to the nucleotide sequence of VGAM47 RNA, herein designated VGAM RNA, also designated SEQ ID:382.

[1083] Another function of VGAM47 is therefore inhibition of LOC221035 (Accession XM_167640). Accordingly, utilities of VGAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221035. LOC51611 (Accession NM_015958) is another VGAM47 host target gene. LOC51611 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC51611, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51611 BINDING SITE, designated SEQ ID:1653, to the nucleotide sequence of VGAM47 RNA, herein designated VGAM RNA, also designated SEQ ID:382.

[1084] Another function of VGAM47 is therefore inhibition of LOC51611 (Accession NM_015958). Accordingly, utilities of VGAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51611. Fig. 1 further provides a conceptual descrip-

tion of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 48 (VGAM48) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[1085] VGAM48 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM48 was detected is described hereinabove with reference to Figs. 1–8.

[1086] VGAM48 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus. VGAM48 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[1087] VGAM48 gene encodes a VGAM48 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM48 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM48 precursor RNA is designated SEQ ID:34, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:34 is located at position 3681 relative to the genome of Vac–

cinia Virus.

[1088] VGAM48 precursor RNA folds onto itself, forming VGAM48 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[1089] An enzyme complex designated DICER COMPLEX, `dices` the VGAM48 folded precursor RNA into VGAM48 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 75%) nucleotide sequence of VGAM48 RNA is designated SEQ ID:383, and is provided hereinbelow with reference to the sequence listing part.

[1090] VGAM48 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA,

VGAM48 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM48 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[1091] VGAM48 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM48 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM48 RNA is an accurate or a partial inverted-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM48 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM48 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig.

1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[1092] The complementary binding of VGAM48 RNA, herein designated VGAM RNA, to host target binding sites on VGAM48 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM48 host target RNA into VGAM48 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[1093] It is appreciated that VGAM48 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM48 host target genes. The mRNA of each one of this plurality of VGAM48 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM48 RNA, herein designated VGAM RNA, and which when bound by VGAM48 RNA causes inhibition of translation of respective one or more VGAM48 host target proteins.

[1094] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM48 gene, herein designated VGAM GENE, on one or more VGAM48 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[1095] It is yet further appreciated that a function of VGAM48 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM48 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM48 correlate with, and may be deduced from, the identity of the host target genes which VGAM48 binds and inhibits, and the

function of these host target genes, as elaborated herein—below.

[1096] Nucleotide sequences of the VGAM48 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM48 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM48 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM48 are further described hereinbelow with reference to Table 1.

[1097] Nucleotide sequences of host target binding sites, such as BINDING SITE–I, BINDING SITE–II and BINDING SITE–III of Fig. 1, found on VGAM48 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM48 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[1098] As mentioned hereinabove with reference to Fig. 1, a function of VGAM48 gene, herein designated VGAM is inhibition of expression of VGAM48 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM48 correlate with, and may be deduced from, the identity of the target genes which VGAM48 binds and inhibits, and the function of these target genes, as elabo—

rated hereinbelow.

[1099] AXIN1 Up-regulated 1 (AXUD1, Accession NM_033027) is a VGAM48 host target gene. AXUD1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by AXUD1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AXUD1 BINDING SITE, designated SEQ ID:2309, to the nucleotide sequence of VGAM48 RNA, herein designated VGAM RNA, also designated SEQ ID:383.

[1100] A function of VGAM48 is therefore inhibition of AXIN1 Up-regulated 1 (AXUD1, Accession NM_033027). Accordingly, utilities of VGAM48 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AXUD1. Bassoon (presynaptic cytomatrix protein) (BSN, Accession NM_003458) is another VGAM48 host target gene. BSN BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BSN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BSN BINDING SITE, designated SEQ ID:1024, to

the nucleotide sequence of VGAM48 RNA, herein designated VGAM RNA, also designated SEQ ID:383.

[1101] Another function of VGAM48 is therefore inhibition of Bassoon (presynaptic cytomatrix protein) (BSN, Accession NM_003458), a gene which may be involved in cytomatrix organization at the site of neurotransmitter release. Accordingly, utilities of VGAM48 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BSN. The function of BSN has been established by previous studies. Both the presynaptic terminal and the postsynaptic compartment of neuronal synapses comprise a highly specialized cytoskeleton underlying the synaptic membranes. The presynaptic nerve terminal is the principal site of regulated neurotransmitter release. The active zone is the region of the presynaptic plasmalemma over which synaptic vesicles dock, fuse, and release neurotransmitter. Piccolo (PCLO; 604918), a 420-kD protein, is 1 component of the presynaptic cytomatrix. Tom Dieck et al. (1998) isolated a large (greater than 400 kD) protein in mouse that is also found in the presynaptic compartments of rat brain synapses. They designated the protein Bassoon because it, along with Piccolo, is part of the ensemble of presynaptic proteins that are involved in

orchestrating events at the nerve terminal. Bassoon is found in axon terminals of hippocampal neurons where it is highly concentrated in the vicinity of the active zone. Piccolo has a similar distribution and colocalizes with Bassoon in cultured hippocampal cells. Tom Dieck et al. (1998) suggested that Bassoon may be involved in cytomatrix organization at the site of neurotransmitter release. Multiple system atrophy (MSA) is a sporadic progressive neurodegenerative disease. By differential hybridization to high-density cDNA filters, Hashida et al. (1998) identified human frontal lobe cDNAs with altered expression patterns in MSA patients. One partial cDNA whose expression was elevated 2-fold in MSA cerebella encoded a protein that the authors designated ZNF231 (zinc finger protein-231). By screening additional libraries with the partial cDNA, they assembled a full-length ZNF231 cDNA. The predicted 3,926-amino acid protein contains 2 glycine-proline dipeptide repeats, a pair of homologous C8 double zinc finger motifs, a leucine zipper motif, an SH3 domain-binding motif, 2 nuclear targeting sequences, 2 glutamine-rich domains, and a histidine-rich domain. Northern blot analysis of rat tissues indicated that the ZNF231 gene was expressed as a 16-kb

mRNA specifically in brain. By RT-PCR of human brain cell lines and tissue, Hashida et al. (1998) determined that ZNF231 was expressed in the cerebellum and in a neuroblastoma cell line, but not in the white matter. Ishikawa et al. (1997) recovered a ZNF231 cDNA, designated KIAA0434, as 1 of 78 brain cDNAs that may encode large proteins. Gundelfinger (1999) stated that ZNF231 is the human homolog of Bassoon

[1102] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[1105] Further studies establishing the function and utilities of

BSN are found in John Hopkins OMIM database record ID 604020, and in cited publications numbered 1737–1738, 25 and 1748–1749 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Dihydropyrimidinase–like 2 (DPYSL2, Accession NM_001386) is another VGAM48 host target gene. DPYSL2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DPYSL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DPYSL2 BINDING SITE, designated SEQ ID:822, to the nucleotide sequence of VGAM48 RNA, herein designated VGAM RNA, also designated SEQ ID:383.

[1106] Another function of VGAM48 is therefore inhibition of Dihydropyrimidinase–like 2 (DPYSL2, Accession NM_001386), a gene which is a member of the dihydropyrimidinase family. Accordingly, utilities of VGAM48 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DPYSL2. The function of DPYSL2 has been established by previous studies. Hamajima et al. (1996) isolated a human cDNA encoding dihydropyrimidinase–like 2 (OMIM Ref. No. DPYSL2), called

DRP2 by them, from a fetal brain cDNA library (see OMIM Ref. No. 222748). The DPYSL2 protein has 572 amino acids. Northern blot analysis detected a 4.9-kb DPYSL2 transcript in all tissues examined except liver. Hamajima et al. (1996) noted that 3 ESTs mapped to 8p21 by Koyama et al. (1995) correspond to a portion of the coding region of DPYSL2.

[1107] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[1108] Hamajima, N.; Matsuda, K.; Sakata, S.; Tamaki, N.; Sasaki, M.; Nonaka, M. : A novel gene family defined by human dihydropyrimidinase and three related proteins with differential tissue distribution. *Gene* 180: 157–163, 1996. ; and

[1109] Koyama, K.; Sudo, K.; Nakamura, Y. : Isolation of 115 human chromosome 8-specific expressed-sequence tags by exon amplification. *Genomics* 26: 245–253, 1995.

[1110] Further studies establishing the function and utilities of DPYSL2 are found in John Hopkins OMIM database record ID 602463, and in cited publications numbered 75 and 1441 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Epithelial V-like

Antigen 1 (EVA1, Accession NM_005797) is another VGAM48 host target gene. EVA1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EVA1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EVA1 BINDING SITE, designated SEQ ID:1250, to the nucleotide sequence of VGAM48 RNA, herein designated VGAM RNA, also designated SEQ ID:383.

[1111] Another function of VGAM48 is therefore inhibition of Epithelial V-like Antigen 1 (EVA1, Accession NM_005797). Accordingly, utilities of VGAM48 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EVA1. Parathymosin (PTMS, Accession NM_002824) is another VGAM48 host target gene. PTMS BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PTMS, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PTMS BINDING SITE, designated SEQ ID:959, to the nucleotide sequence of VGAM48 RNA, herein designated

VGAM RNA, also designated SEQ ID:383.

[1112] Another function of VGAM48 is therefore inhibition of Parathymosin (PTMS, Accession NM_002824), a gene which is involved in the regulation of cellular immunity. Accordingly, utilities of VGAM48 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTMS. The function of PTMS has been established by previous studies. Parathymosin is a polypeptide similar in size and amino acid composition to prothymosin-alpha (OMIM Ref. No. 188390). It has a high content of dicarboxylic amino acids and a complete absence of aromatic and sulfur-containing amino acids. It has 101 amino acid residues as compared to 111 for prothymosin. Clinton et al. (1989) reported the isolation of a cDNA clone for human kidney parathymosin containing the complete coding region and extending into the 5-prime and 3-prime flanking sequences. The open reading frame contains 306 nucleotides, including the codon for the initiator methionine. Analysis of the 5-prime flanking sequence excluded the presence of a hydrophobic signal peptide in the translated sequence. This permitted the conclusion that parathymosin, like prothymosin-alpha, is synthesized without formation of a larger precursor

polypeptide. Parathymosin and prothymosin show a reciprocal relationship: the highest levels of parathymosin and its mRNA are present in liver, kidney, and brain (with lowest levels in thymus and spleen), whereas prothymosin- α and its mRNA are present in highest concentrations in thymus and spleen (with lower levels in kidney, brain, and liver). By in situ hybridization of rat parathymosin cDNA to human metaphase chromosomes, Szabo et al. (1989) localized the gene for human parathymosin to 17q12-q22.

[1113] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[1114] Clinton, M.; Frangou-Lazaridis, M.; Panneerselvam, C.; Horecker, B. L. : The sequence of human parathymosin deduced from a cloned human kidney cDNA. *Biochem. Biophys. Res. Commun.* 158: 855-862, 1989. ; and

[1115] Szabo, P.; Clinton, M.; Macera, M.; Horecker, B. L. : Localization of the gene coding for parathymosin to chromosome 17 in humans. *Cytogenet. Cell Genet.* 50: 91-92, 1989.

[1116] Further studies establishing the function and utilities of PTMS are found in John Hopkins OMIM database record ID 168440, and in cited publications numbered 572-573

listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Selectin E (endothelial adhesion molecule 1) (SELE, Accession NM_000450) is another VGAM48 host target gene. SELE BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SELE, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SELE BINDING SITE, designated SEQ ID:748, to the nucleotide sequence of VGAM48 RNA, herein designated VGAM RNA, also designated SEQ ID:383.

[1117] Another function of VGAM48 is therefore inhibition of Selectin E (endothelial adhesion molecule 1) (SELE, Accession NM_000450), a gene which expressed on cytokine induced endothelial cells and mediates their binding to leukocytes. Accordingly, utilities of VGAM48 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SELE. The function of SELE and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM15. Solute Carrier Family 7 (cationic amino acid transporter, γ^+ sys-

tem), Member 6 (SLC7A6, Accession NM_003983) is another VGAM48 host target gene. SLC7A6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC7A6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC7A6 BINDING SITE, designated SEQ ID:1076, to the nucleotide sequence of VGAM48 RNA, herein designated VGAM RNA, also designated SEQ ID:383.

[1118] Another function of VGAM48 is therefore inhibition of Solute Carrier Family 7 (cationic amino acid transporter, γ^+ system), Member 6 (SLC7A6, Accession NM_003983), a gene which is involved in mediating amino acid transport. Accordingly, utilities of VGAM48 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC7A6. The function of SLC7A6 has been established by previous studies. Using RT-PCR with degenerate primers to screen for amino acid transporters in opossum kidney, followed by searching EST databases, Torrents et al. (1998) obtained a cDNA encoding SLC7A6, which they called $\gamma(+)$ LAT2. SLC7A6 is identical to the KIAA0245 gene reported by Nagase et al. (1996). Se-

quence analysis predicted that SLC7A6 is a 515–amino acid, typical organic solute transporter protein with 12 transmembrane domains, 3 potential phosphorylation sites, and N– and C–terminal cytoplasmic segments. SLC7A6 shares 75% amino acid identity with the opossum sequence and $\gamma(+)$ LAT1 (SLC7A7; 603593). By RT–PCR analysis, Nagase et al. (1996) detected SLC7A6 expression in all tissues tested except liver; expression was weak in pancreas and highest in thymus.

[1119] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[1120] Nagase, T.; Seki, N.; Ishikawa, K.; Ohira, M.; Kawarabayasi, Y.; Ohara, O.; Tanaka, A.; Kotani, H.; Miyajima, N.; Nomura, N. : Prediction of the coding sequences of unidentified human genes. VI. The coding sequences of 80 new genes (KIAA0201–KIAA0280) deduced by analysis of cDNA clones from cell line KG–1 and brain. DNA Res. 3: 321–329, 1996. ; and

[1121] Torrents, D.; Estevez, R.; Pineda, M.; Fernandez, E.; Lloberas, J.; Shi, Y.–B.; Zorzano, A.; Palacin, M. : Identification and characterization of a membrane protein ($\gamma(+)$ L amino acid tr.

[1122] Further studies establishing the function and utilities of SLC7A6 are found in John Hopkins OMIM database record ID 605641, and in cited publications numbered 2121 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Transforming Growth Factor, Beta Receptor II (70/80kDa) (TGFB2, Accession NM_003242) is another VGAM48 host target gene. TGFB2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by TGFB2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TGFB2 BINDING SITE, designated SEQ ID:1003, to the nucleotide sequence of VGAM48 RNA, herein designated VGAM RNA, also designated SEQ ID:383.

[1123] Another function of VGAM48 is therefore inhibition of Transforming Growth Factor, Beta Receptor II (70/80kDa) (TGFB2, Accession NM_003242). Accordingly, utilities of VGAM48 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TGFB2. DKFZP586N0721 (Accession NM_015400) is another VGAM48 host target gene. DKFZP586N0721 BINDING SITE

is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by DKFZP586N0721, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP586N0721 BINDING SITE, designated SEQ ID:1627, to the nucleotide sequence of VGAM48 RNA, herein designated VGAM RNA, also designated SEQ ID:383.

[1124] Another function of VGAM48 is therefore inhibition of DKFZP586N0721 (Accession NM_015400). Accordingly, utilities of VGAM48 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP586N0721. DKFZp761J139 (Accession NM_032280) is another VGAM48 host target gene. DKFZp761J139 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by DKFZp761J139, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp761J139 BINDING SITE, designated SEQ ID:2242, to the nucleotide sequence of VGAM48 RNA, herein designated VGAM RNA, also designated SEQ ID:383.

[1125] Another function of VGAM48 is therefore inhibition of DK-FZp761J139 (Accession NM_032280). Accordingly, utilities of VGAM48 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DK-FZp761J139. FLJ10468 (Accession NM_018101) is another VGAM48 host target gene. FLJ10468 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ10468, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10468 BINDING SITE, designated SEQ ID:1779, to the nucleotide sequence of VGAM48 RNA, herein designated VGAM RNA, also designated SEQ ID:383.

[1126] Another function of VGAM48 is therefore inhibition of FLJ10468 (Accession NM_018101). Accordingly, utilities of VGAM48 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10468. FLJ20485 (Accession NM_019042) is another VGAM48 host target gene. FLJ20485 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ20485, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or

BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20485 BINDING SITE, designated SEQ ID:1874, to the nucleotide sequence of VGAM48 RNA, herein designated VGAM RNA, also designated SEQ ID:383.

[1127] Another function of VGAM48 is therefore inhibition of FLJ20485 (Accession NM_019042). Accordingly, utilities of VGAM48 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20485. H2B Histone Family, Member Q (H2BFQ, Accession XM_001940) is another VGAM48 host target gene. H2BFQ BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by H2BFQ, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of H2BFQ BINDING SITE, designated SEQ ID:2523, to the nucleotide sequence of VGAM48 RNA, herein designated VGAM RNA, also designated SEQ ID:383.

[1128] Another function of VGAM48 is therefore inhibition of H2B Histone Family, Member Q (H2BFQ, Accession XM_001940). Accordingly, utilities of VGAM48 include diagnosis, prevention and treatment of diseases and clinical

conditions associated with H2BFQ. KIAA0077 (Accession XM_040158) is another VGAM48 host target gene.

KIAA0077 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0077, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0077 BINDING SITE, designated SEQ ID:2774, to the nucleotide sequence of VGAM48 RNA, herein designated VGAM RNA, also designated SEQ ID:383.

[1129] Another function of VGAM48 is therefore inhibition of KIAA0077 (Accession XM_040158). Accordingly, utilities of VGAM48 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0077. KIAA0295 (Accession XM_042833) is another VGAM48 host target gene. KIAA0295 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0295, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0295 BINDING SITE, designated SEQ ID:2807, to the

nucleotide sequence of VGAM48 RNA, herein designated VGAM RNA, also designated SEQ ID:383.

[1130] Another function of VGAM48 is therefore inhibition of KIAA0295 (Accession XM_042833). Accordingly, utilities of VGAM48 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0295. KIAA0828 (Accession XM_088105) is another VGAM48 host target gene. KIAA0828 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0828, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0828 BINDING SITE, designated SEQ ID:3195, to the nucleotide sequence of VGAM48 RNA, herein designated VGAM RNA, also designated SEQ ID:383.

[1131] Another function of VGAM48 is therefore inhibition of KIAA0828 (Accession XM_088105). Accordingly, utilities of VGAM48 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0828. KIAA1203 (Accession XM_049683) is another VGAM48 host target gene. KIAA1203 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by KIAA1203, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1203 BINDING SITE, designated SEQ ID:2921, to the nucleotide sequence of VGAM48 RNA, herein designated VGAM RNA, also designated SEQ ID:383.

[1132] Another function of VGAM48 is therefore inhibition of KIAA1203 (Accession XM_049683). Accordingly, utilities of VGAM48 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1203. Oxysterol Binding Protein-like 8 (OSBPL8, Accession NM_020841) is another VGAM48 host target gene. OSBPL8 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by OSBPL8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OSBPL8 BINDING SITE, designated SEQ ID:1928, to the nucleotide sequence of VGAM48 RNA, herein designated VGAM RNA, also designated SEQ ID:383.

[1133] Another function of VGAM48 is therefore inhibition of

Oxysterol Binding Protein-like 8 (OSBPL8, Accession NM_020841). Accordingly, utilities of VGAM48 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OSBPL8.

p21(CDKN1A)-activated Kinase 6 (PAK6, Accession NM_020168) is another VGAM48 host target gene. PAK6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PAK6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PAK6 BINDING SITE, designated SEQ ID:1897, to the nucleotide sequence of VGAM48 RNA, herein designated VGAM RNA, also designated SEQ ID:383.

[1134] Another function of VGAM48 is therefore inhibition of p21(CDKN1A)-activated Kinase 6 (PAK6, Accession NM_020168). Accordingly, utilities of VGAM48 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PAK6. Polymerase (RNA) III (DNA directed) Polypeptide F, 39 KDa (POLR3F, Accession XM_009639) is another VGAM48 host target gene. POLR3F BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by POLR3F, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of POLR3F BINDING SITE, designated SEQ ID:2547, to the nucleotide sequence of VGAM48 RNA, herein designated VGAM RNA, also designated SEQ ID:383.

[1135] Another function of VGAM48 is therefore inhibition of Polymerase (RNA) III (DNA directed) Polypeptide F, 39 KDa (POLR3F, Accession XM_009639). Accordingly, utilities of VGAM48 include diagnosis, prevention and treatment of diseases and clinical conditions associated with POLR3F. Ring Finger Protein 11 (RNF11, Accession NM_014372) is another VGAM48 host target gene. RNF11 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RNF11, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RNF11 BINDING SITE, designated SEQ ID:1495, to the nucleotide sequence of VGAM48 RNA, herein designated VGAM RNA, also designated SEQ ID:383.

[1136] Another function of VGAM48 is therefore inhibition of Ring Finger Protein 11 (RNF11, Accession NM_014372).

Accordingly, utilities of VGAM48 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RNF11. Solute Carrier Family 16 (monocarboxylic acid transporters), Member 6 (SLC16A6, Accession NM_004694) is another VGAM48 host target gene. SLC16A6 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by SLC16A6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC16A6 BINDING SITE, designated SEQ ID:1143, to the nucleotide sequence of VGAM48 RNA, herein designated VGAM RNA, also designated SEQ ID:383.

[1137] Another function of VGAM48 is therefore inhibition of Solute Carrier Family 16 (monocarboxylic acid transporters), Member 6 (SLC16A6, Accession NM_004694). Accordingly, utilities of VGAM48 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC16A6. LOC144321 (Accession XM_096578) is another VGAM48 host target gene. LOC144321 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC144321, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144321 BINDING SITE, designated SEQ ID:3267, to the nucleotide sequence of VGAM48 RNA, herein designated VGAM RNA, also designated SEQ ID:383.

[1138] Another function of VGAM48 is therefore inhibition of LOC144321 (Accession XM_096578). Accordingly, utilities of VGAM48 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144321. LOC150951 (Accession XM_097975) is another VGAM48 host target gene. LOC150951 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC150951, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150951 BINDING SITE, designated SEQ ID:3336, to the nucleotide sequence of VGAM48 RNA, herein designated VGAM RNA, also designated SEQ ID:383.

[1139] Another function of VGAM48 is therefore inhibition of LOC150951 (Accession XM_097975). Accordingly, utilities of VGAM48 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LOC150951. LOC199920 (Accession XM_114056) is another VGAM48 host target gene. LOC199920 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC199920, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC199920 BINDING SITE, designated SEQ ID:3435, to the nucleotide sequence of VGAM48 RNA, herein designated VGAM RNA, also designated SEQ ID:383.

[1140] Another function of VGAM48 is therefore inhibition of LOC199920 (Accession XM_114056). Accordingly, utilities of VGAM48 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC199920. LOC256435 (Accession XM_170925) is another VGAM48 host target gene. LOC256435 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC256435, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256435 BINDING SITE, designated SEQ ID:3675, to

the nucleotide sequence of VGAM48 RNA, herein designated VGAM RNA, also designated SEQ ID:383.

[1141] Another function of VGAM48 is therefore inhibition of LOC256435 (Accession XM_170925). Accordingly, utilities of VGAM48 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256435. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 49 (VGAM49) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[1142] VGAM49 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM49 was detected is described hereinabove with reference to Figs. 1–8.

[1143] VGAM49 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus. VGAM49 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[1144] VGAM49 gene encodes a VGAM49 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, VGAM49 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM49 precursor RNA is designated SEQ ID:35, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:35 is located at position 3573 relative to the genome of Vaccinia Virus.

[1145] VGAM49 precursor RNA folds onto itself, forming VGAM49 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[1146] An enzyme complex designated DICER COMPLEX, `dices` the VGAM49 folded precursor RNA into VGAM49 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of VGAM49 RNA is designated SEQ ID:384, and is provided hereinbelow with reference to the sequence listing part.

[1147] VGAM49 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM49 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM49 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[1148] VGAM49 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM49 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM49 RNA is an accurate or a partial inverted-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III

respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM49 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM49 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR and 5' UTR regions.

[1149] The complementary binding of VGAM49 RNA, herein designated VGAM RNA, to host target binding sites on VGAM49 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM49 host target RNA into VGAM49 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[1150] It is appreciated that VGAM49 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM49 host target genes. The mRNA of each one of this plurality of VGAM49 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM49 RNA, herein designated VGAM RNA, and which when bound by VGAM49 RNA causes inhibition of translation of respective one or more VGAM49 host target proteins.

[1151] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM49 gene, herein designated VGAM GENE, on one or more VGAM49 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[1152] It is yet further appreciated that a function of VGAM49 is

inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM49 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM49 correlate with, and may be deduced from, the identity of the host target genes which VGAM49 binds and inhibits, and the function of these host target genes, as elaborated herein—below.

[1153] Nucleotide sequences of the VGAM49 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM49 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM49 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM49 are further described hereinbelow with reference to Table 1.

[1154] Nucleotide sequences of host target binding sites, such as BINDING SITE–I, BINDING SITE–II and BINDING SITE–III of Fig. 1, found on VGAM49 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM49 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[1155] As mentioned hereinabove with reference to Fig. 1, a function of VGAM49 gene, herein designated VGAM is inhibition of expression of VGAM49 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM49 correlate with, and may be deduced from, the identity of the target genes which VGAM49 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[1156] A Disintegrin-like and Metalloprotease (reprolysin type) with Thrombospondin Type 1 Motif, 5 (aggrecanase-2) (ADAMTS5, Accession NM_007038) is a VGAM49 host target gene. ADAMTS5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ADAMTS5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ADAMTS5 BINDING SITE, designated SEQ ID:1352, to the nucleotide sequence of VGAM49 RNA, herein designated VGAM RNA, also designated SEQ ID:384.

[1157] A function of VGAM49 is therefore inhibition of A Disintegrin-like and Metalloprotease (reprolysin type) with Thrombospondin Type 1 Motif, 5 (aggrecanase-2)

(ADAMTS5, Accession NM_007038), a gene which cleaves aggrecan, a cartilage proteoglycan, and may be involved in its turnover. Accordingly, utilities of VGAM49 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADAMTS5. The function of ADAMTS5 has been established by previous studies. Proteolysis of the extracellular matrix plays a critical role in establishing tissue architecture during development and in tissue degradation in diseases such as cancer, arthritis, Alzheimer disease, and a variety of inflammatory conditions. The proteolytic enzymes responsible include members of diverse protease families and they may work in concert or in cascades to degrade or process molecules. Two groups of zinc metalloproteinases in particular, ADAMs and MMPs (e.g., 600754), appear broadly relevant to extracellular proteolysis. Most ADAM family members are quite similar in domain organization, bearing, from amino to carboxyl termini, a signal peptide, a proregion, a zinc metalloprotease catalytic domain with the typical reptolysin signature motif, a disintegrin domain, a cysteine-rich domain, an EGF-like domain, and, in many cases, a membrane-spanning region and a cytoplasmic domain with signaling potential. Members of the ADAMTS family

differ substantially from the prototypic ADAM structure in that they lack the EGF-like domain, do not have a canonical disintegrin sequence, and possess modules with similar thrombospondin type 1 repeats. By searching an EST database using the protein sequences of human ADAMTS1 to ADAMTS4 and a *C. elegans* ADAMTS as queries, Hurskainen et al. (1999) identified ADAMTS5, ADAMTS6 (OMIM Ref. No. 605008), and ADAMTS7 (OMIM Ref. No. 605009). They determined a partial human ADAMTS5 cDNA sequence that lacked 5-prime coding sequence. The predicted partial ADAMTS5 protein has the domain structure characteristic of ADAMTSs, beginning with a partial metalloproteinase domain. Northern blot analysis of several human tissues detected an approximately 10-kb ADAMTS5 transcript that was expressed at a low level in placenta and at barely detectable levels in a number of other tissues. Northern blot analysis showed that mouse *Adamts5* was specifically expressed in a 7-day mouse embryo, and at low or undetectable levels thereafter. In situ hybridization of an 8.5-day mouse embryo showed uniform *Adamts5* expression throughout the embryo. In addition, *Adamts5* expression was found in trophoblastic cells lining the uterine cavity, in the developing placenta,

and in the decidual reaction within the uterus. In a 10.5-day mouse embryo, Adamts5 expression was widespread, but at a lower level than in the 8.5-day embryo. Expression was found in mesenchyme and somites, as well as in the neural tube and developing hindgut. Abbaszade et al. (1999) demonstrated that recombinant ADAMTS5 expressed in insect cells cleaves aggrecan at the glu373-ala374 site, with the cleavage pattern and inhibitor profile indistinguishable from that observed with native aggrecanase. Northern blot analysis of several human tissues showed highest ADAMTS5 expression in placenta, with much lower expression in heart and brain. Major transcripts of 12.4, 10.7, 8.6, and 6.6 kb were detected. Real time PCR of a number of normal human tissues detected ADAMTS5 expression in placenta, cervix, uterus, bladder, and esophagus. Expression was also found in rib cartilage, chondroblastoma, and fibrous tissue and joint capsule samples from an arthritic patient.

[1158] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[1159] Abbaszade, I.; Liu, R.-Q.; Yang, F.; Rosenfeld, S. A.; Ross, O. H.; Link, J. R.; Ellis, D. M.; Tortorella, M. D.; Pratta, M.

A.; Hollis, J. M.; Wynn, R.; Duke, J. L.; and 15 others :
Cloning and characterization of ADAMTS11, an aggrecanase from the ADAMTS family. J. Biol. Chem. 274: 23443–23450, 1999. ; and

[1160] Hurskainen, T. L.; Hirohata, S.; Seldin, M. F.; Apte, S. S. :
ADAM-TS5, ADAM-TS6, and ADAM-TS7, novel members of a new family of zinc metalloproteases: general features and genomic dis.

[1161] Further studies establishing the function and utilities of ADAMTS5 are found in John Hopkins OMIM database record ID 605007, and in cited publications numbered 67 and 1735 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Adenosine Deaminase, tRNA-specific 1 (ADAT1, Accession NM_012091) is another VGAM49 host target gene. ADAT1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ADAT1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ADAT1 BINDING SITE, designated SEQ ID:1404, to the nucleotide sequence of VGAM49 RNA, herein designated VGAM RNA, also designated SEQ

ID:384.

[1162] Another function of VGAM49 is therefore inhibition of Adenosine Deaminase, TRNA-specific 1 (ADAT1, Accession NM_012091), a gene which TRNA-specific adenosine deaminase; deaminates A(37) in the anticodon loop of tRNA(Ala). Accordingly, utilities of VGAM49 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADAT1. The function of ADAT1 has been established by previous studies. The mammalian RNA-specific adenosine deaminases (ADARs; OMIM Ref. No. 601059) constitute a family of sequence-related proteins involved in pre-mRNA editing of nuclear transcripts through site-specific adenosine modification. Maas et al. (1999) identified and characterized a human ADAR-related protein that specifically deaminates adenosine-37 to inosine in eukaryotic tRNA(ala). They designated this predicted 502-amino acid protein 'adenosine deaminase acting on tRNA,' or ADAT1, and concluded that it probably represents the human counterpart of the yeast protein Tad1p. Southern blot analysis revealed that the ADAT1 enzyme is represented by a single gene. Northern blot analysis detected ADAT1 transcripts of approximately 5 and 6.5 kb in all human tissues, with highest expression

levels in heart, brain, and pancreas. By radiation hybrid panel analysis, Maas et al. (2001) mapped the ADAT1 gene and the gene encoding lysyl tRNA synthetase (KARS; 601421) to 16q22.2–q22.3, with the gene for alanyl tRNA synthetase (AARS; 601065) positioned centromeric to the KARS and ADAT1 genes. They speculated that the clustering of 3 tRNA-specific genes, of which 2 are specific for tRNA(Ala), may indicate their evolutionary relatedness or common factors involved in regulating their expression.

[1163] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[1164] Maas, S.; Gerber, A. P.; Rich, A. : Identification and characterization of a human tRNA-specific adenosine deaminase related to the ADAR family of pre-mRNA editing enzymes. *Proc. Nat. Acad. Sci.* 96: 8895–8900, 1999. ; and

[1165] Maas, S.; Kim, Y.-G.; Rich, A. : Genomic clustering of tRNA-specific adenosine deaminase ADAT1 and two tRNA synthetases. *Mammalian Genome* 12: 387–393, 2001.

[1166] Further studies establishing the function and utilities of ADAT1 are found in John Hopkins OMIM database record ID 604230, and in cited publications numbered 118 and 1787 listed in the bibliography section hereinbelow, which

are also hereby incorporated by reference. Adenylate Cyclase 2 (brain) (ADCY2, Accession XM_036383) is another VGAM49 host target gene. ADCY2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ADCY2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ADCY2 BINDING SITE, designated SEQ ID:2711, to the nucleotide sequence of VGAM49 RNA, herein designated VGAM RNA, also designated SEQ ID:384.

[1167] Another function of VGAM49 is therefore inhibition of Adenylate Cyclase 2 (brain) (ADCY2, Accession XM_036383), a gene which Adenylate cyclase (type 2), an ATP-pyrophosphate lyase; converts ATP to cAMP. Accordingly, utilities of VGAM49 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADCY2. The function of ADCY2 has been established by previous studies. Stengel et al. (1992) identified a brain cDNA corresponding to a gene that encodes a human brain adenylyl cyclase, which they symbolized HBAC2. The amino acid sequence of ADCY2 displayed significant homology with ADCY8 (OMIM Ref. No. 103070) in

the highly conserved adenylyl cyclase domain (250 amino acids) found in the 3-prime cytoplasmic portion of all mammalian adenylyl cyclases. However, outside this domain, the homology was extremely low. By in situ hybridization to metaphase chromosomal spreads using a human brain cDNA probe, they demonstrated that the ADCY2 gene maps to 5p15.3. There was no cross-reactivity with the site on 8q24.2 where ADCY8 was found to map. Using Southern blot analysis of somatic cell hybrid DNAs, Gaudin et al. (1994) likewise mapped type II adenylyl cyclase to chromosome 5. Furthermore, they determined the chromosomal location of 4 other isoforms: type III on chromosome 2, type IV on chromosome 14, type V on chromosome 3, and type VI on chromosome 12. By fluorescence in situ hybridization, Edelhoff et al. (1995) mapped the mouse homolog to chromosome 13 in the C1 region. Wong et al. (2000) identified the presence of adenylyl cyclases 2, 3 (OMIM Ref. No. 600291), and 4 (OMIM Ref. No. 600292) in olfactory cilia.

[1168] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[1169] Edelhoff, S.; Villacres, E. C.; Storm, D. R.; Disteche, C. M. :

- Mapping of adenylyl cyclase genes type I, II, III, IV, V, and VI in mouse. Mammalian Genome 6: 111–113, 1995. ; and

- [1171] Further studies establishing the function and utilities of ADCY2 are found in John Hopkins OMIM database record ID 103071, and in cited publications numbered 85–86, 8 and 87 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Aryl Hydrocarbon Receptor (AHR, Accession NM_001621) is another VGAM49 host target gene. AHR BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by AHR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AHR BINDING SITE, designated SEQ ID:840, to the nucleotide sequence of VGAM49 RNA, herein designated VGAM RNA, also designated SEQ ID:384.
- [1172] Another function of VGAM49 is therefore inhibition of Aryl Hydrocarbon Receptor (AHR, Accession NM_001621), a

gene which plays a role in modulating carcinogenesis through the induction of xenobiotic-metabolizing enzymes. Accordingly, utilities of VGAM49 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AHR. The function of AHR has been established by previous studies. Halogenated aromatic hydrocarbons, represented by 2,3,7,8-tetrachlorodibenzo-p-dioxin (TCDD), are environmental pollutants that are produced by minor side-reactions in chemical manufacturing processes and by combustion of waste materials. These chemicals cause potent and pleiotropic toxicity, including teratogenesis, immune suppression, epithelial disorders, and tumor production in experimental animals. At the molecular level, aldehyde dehydrogenase, quinone reductase, and various drug-metabolizing enzymes are induced by the chemicals in some cultured cells and some tissues of experimental animals. All these biologic effects are thought to be mediated by an intracellular aryl hydrocarbon receptor (AHR). By fluorescence in situ hybridization and by DNA blot hybridization using human/mouse or human/Chinese hamster hybrid cell DNAs, Ema et al. (1994) assigned the AHR gene to 7p21. By use of PCR analysis of somatic cell hy-

brids and fluorescence in situ hybridization of metaphase cells, Le Beau et al. (1994) localized the AHR gene to 7p21–p15. Micka et al. (1997) localized the AHR gene to 7p15 using fluorescence in situ hybridization. Performing linkage analysis in a 3–generation family, they showed with good probability that the high CYP1A1 (OMIM Ref. No. 108330) inducibility phenotype segregates with the 7p15 region. Animal model experiments lend further support to the function of AHR. To determine whether the aryl hydrocarbon receptor plays a role in modulating carcinogenesis through the induction of xenobiotic–metabolizing enzymes, Shimizu et al. (2000) studied Ahr–deficient mice exposed to benzo(a)pyrene, a widely distributed environmental carcinogen.

[1173] It is appreciated that the abovementioned animal model for AHR is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[1174] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[1175] Ema, M.; Matsushita, N.; Sogawa, K.; Ariyama, T.; Inazawa, J.; Nemoto, T.; Ota, M.; Oshimura, M.; Fujii–Kuriyama, Y. :

Human arylhydrocarbon receptor: functional expression and chromosomal assignment to 7p21. J. Biochem. 116: 845–851, 1994. ; and

[1176] Shimizu, Y.; Nakatsuru, Y.; Ichinose, M.; Takahashi, Y.; Kume, H.; Mimura, J.; Fujii–Kuriyama, Y.; Ishikawa, T. : Benzo[a]pyrene carcinogenicity is lost in mice lacking the aryl hydrocar.

[1177] Further studies establishing the function and utilities of AHR are found in John Hopkins OMIM database record ID 600253, and in cited publications numbered 1883–1885, 175 and 1886–1887 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Bassoon (presynaptic cytomatrix protein) (BSN, Accession NM_003458) is another VGAM49 host target gene. BSN BINDING SITE1 and BSN BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by BSN, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BSN BINDING SITE1 and BSN BINDING SITE2, designated SEQ ID:1025 and SEQ ID:1026 respectively, to the nucleotide sequence of VGAM49 RNA, herein designated VGAM RNA, also desig–

nated SEQ ID:384.

[1178] Another function of VGAM49 is therefore inhibition of Bassoon (presynaptic cytomatrix protein) (BSN, Accession NM_003458), a gene which may be involved in cytomatrix organization at the site of neurotransmitter release. Accordingly, utilities of VGAM49 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BSN. The function of BSN and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM48. Cystic Fibrosis Transmembrane Conductance Regulator, ATP-binding Cassette (sub-family C, member 7) (CFTR, Accession NM_000492) is another VGAM49 host target gene. CFTR BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CFTR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CFTR BINDING SITE, designated SEQ ID:753, to the nucleotide sequence of VGAM49 RNA, herein designated VGAM RNA, also designated SEQ ID:384.

[1179] Another function of VGAM49 is therefore inhibition of

Cystic Fibrosis Transmembrane Conductance Regulator, ATP-binding Cassette (sub-family C, member 7) (CFTR, Accession NM_000492). Accordingly, utilities of VGAM49 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CFTR. Chromodomain Helicase DNA Binding Protein 2 (CHD2, Accession NM_001271) is another VGAM49 host target gene. CHD2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CHD2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CHD2 BINDING SITE, designated SEQ ID:813, to the nucleotide sequence of VGAM49 RNA, herein designated VGAM RNA, also designated SEQ ID:384.

[1180] Another function of VGAM49 is therefore inhibition of Chromodomain Helicase DNA Binding Protein 2 (CHD2, Accession NM_001271). Accordingly, utilities of VGAM49 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CHD2. Cockayne Syndrome 1 (classical) (CKN1, Accession NM_000082) is another VGAM49 host target gene. CKN1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by CKN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CKN1 BINDING SITE, designated SEQ ID:703, to the nucleotide sequence of VGAM49 RNA, herein designated VGAM RNA, also designated SEQ ID:384.

[1181] Another function of VGAM49 is therefore inhibition of Cockayne Syndrome 1 (classical) (CKN1, Accession NM_000082). Accordingly, utilities of VGAM49 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CKN1. Cystathionase (cystathionine gamma-lyase) (CTH, Accession NM_001902) is another VGAM49 host target gene. CTH BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by CTH, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CTH BINDING SITE, designated SEQ ID:867, to the nucleotide sequence of VGAM49 RNA, herein designated VGAM RNA, also designated SEQ ID:384.

[1182] Another function of VGAM49 is therefore inhibition of

Cystathionase (cystathionine gamma-lyase) (CTH, Accession NM_001902), a gene which catalyzes removal of ammonia, cleaves cystathionine to yield free cys. Accordingly, utilities of VGAM49 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CTH. The function of CTH has been established by previous studies. The rate of glutathione synthesis in the liver is limited by the availability of cysteine which is provided either in the diet or by the trans-sulfuration pathway in which cystathionine derived from methionine is transformed into cysteine by cystathionase (cystathionine gamma-lyase; EC 4.4.1.1). Lu et al. (1992) found and sequenced a 1,083-bp cDNA encoding the human liver cystathionine gamma-lyase. The human sequence presented a deletion of 132 bases (44 amino acids) compared to the cystathionase sequence reported for the rat, and a deletion of 135 bases (45 amino acids) compared to the sequence reported for yeast. After re-alignment for the missing nucleotides, the human cDNA sequence showed significant amino acid homology to the rat (85%) and yeast (50%) enzymes. Using the polymerase chain reaction, Lu et al. (1992) isolated a second clone which contained the missing 132 bases. Flanking nu-

cleotides in the latter clone were identical to those in the cDNA clone containing the deletion. Alternative splicing as the basis of the 2 forms of cystathionase is plausible. During a survey by paper chromatography of amino acids in the urine of patients in an institution for mental defectives, Harris et al. (1959) discovered a case with abnormal excretion of cystathionine. An inborn error involving the cleavage of cystathionine to give cysteine and homoserine was suggested. The subject was a severely retarded female, aged 64 years at the time of study. Another case was studied at The New York Hospital. Other clinical manifestations have been clubfoot, developmental defects about the ears, convulsions, and thrombocytopenia. Urinary lithiasis also occurs. Frimpter (1965) has shown that the defect involves cystathionase that does not properly bind its coenzyme, pyridoxal phosphate. In vitro studies suggested that high pyridoxine would be therapeutically beneficial. Mongeau et al. (1967) described the case of a 2-year-old boy with normal mentality, thrombocytopenia, and urinary calculi. The relation of the latter two features to the metabolic defect was problematical. Both parents (who were apparently unrelated) showed cystathioninuria after methionine loading test. With administration of pyri-

doxine, cystathioninuria was diminished in the proband. Schneiderman (1967) studied 2 mentally retarded brothers who excreted large amounts of cystathionine after methionine ingestion. The mother and another brother excreted lesser but abnormal amounts after methionine loading. The father was not tested. Perry et al. (1968) discovered cystathioninuria in a brother and sister when the brother's urine was by chance subjected to 2-dimensional paper chromatography for amino acids. Both children were normal. The parents excreted cystathionine only after methionine loading. The authors suggested that mental defect and other disorders reported in association with cystathioninuria may have been coincidental. Whelan and Scriver (1968) also found cystathioninuria as an apparently benign inborn error. The case of Tada et al. (1968) did not respond to vitamin

[1183] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[1184] Lu, Y.; O'Dowd, B. F.; Orrego, H.; Israel, Y. : Cloning and nucleotide sequence of human liver cDNA encoding for cystathionine gamma-lyase. Biochem. Biophys. Res. Commun. 189: 749-758, 1992. ; and

- [1185] Whelan, D. T.; Scriver, C. R. : Cystathioninuria and renal iminoglycinuria in a pedigree: a perspective on counseling. New Eng. J. Med. 278: 924–927, 1968.
- [1186] Further studies establishing the function and utilities of CTH are found in John Hopkins OMIM database record ID 219500, and in cited publications numbered 2106–2120 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Epithelial V-like Antigen 1 (EVA1, Accession NM_005797) is another VGAM49 host target gene. EVA1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EVA1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EVA1 BINDING SITE, designated SEQ ID:1251, to the nucleotide sequence of VGAM49 RNA, herein designated VGAM RNA, also designated SEQ ID:384.
- [1187] Another function of VGAM49 is therefore inhibition of Epithelial V-like Antigen 1 (EVA1, Accession NM_005797). Accordingly, utilities of VGAM49 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EVA1. F-box and Leucine-rich Repeat Pro-

tein 11 (FBXL11, Accession NM_012308) is another VGAM49 host target gene. FBXL11 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FBXL11, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FBXL11 BINDING SITE, designated SEQ ID:1426, to the nucleotide sequence of VGAM49 RNA, herein designated VGAM RNA, also designated SEQ ID:384.

[1188] Another function of VGAM49 is therefore inhibition of F-box and Leucine-rich Repeat Protein 11 (FBXL11, Accession NM_012308), a gene which are BTB/POZ domain-containing zinc finger proteins implicated in oncogenesis. Accordingly, utilities of VGAM49 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FBXL11. The function of FBXL11 has been established by previous studies. The F box, named after cyclin F (CCNF; 600227), in which it was originally observed, is an approximately 40-amino acid motif that binds SKP1 (OMIM Ref. No. 601434). F-box proteins are components of modular E3 ubiquitin protein ligases called SCFs (SKP1, OMIM Ref. No. 603134), F-box proteins),

which function in phosphorylation-dependent ubiquitination. Using a yeast 2-hybrid screen with SKP1 as bait, followed by searching sequence databases, Winston et al. (1999) and Cenciarelli et al. (1999) identified 33 mammalian and 26 human F-box proteins, respectively. These contained C termini with leucine-rich repeats (FBXLs, e.g., SKP2 (OMIM Ref. No. 601436)), WD40 domains (FBXWs, e.g., BTRCP (OMIM Ref. No. 603482)), or no recognizable motifs (FBXOs, e.g., CCNF). By searching sequence databases, Ilyin et al. (2000) identified a cDNA encoding FBXL11, which they referred to as FBL7. They predicted that FBXL11, which is identical to the 496-amino acid KIAA1004 protein reported by Nagase et al. (1999), contains at least 6 highly degenerated leucine-rich repeats. By RT-PCR analysis, Nagase et al. (1999) detected ubiquitous expression of FBXL11, with highest levels in brain, testis, and ovary, followed by lung; lowest expression was in pancreas. Within brain, expression was highest in cerebellum and subthalamic nuclei. The International Radiation Hybrid Mapping Consortium mapped the FBXL11 gene to chromosome 11 (sts-Z40471).

[1189] Full details of the abovementioned studies are described in the following publications, the disclosure of which are

hereby incorporated by reference:

- [1190] Ilyin, G. P.; Rialland, M.; Pigeon, C.; Guguen-Guillouzo, C. : cDNA cloning and expression analysis of new members of the mammalian F-box protein family. *Genomics* 67: 40-47, 2000. ; and

- [1192] Further studies establishing the function and utilities of FBXL11 are found in John Hopkins OMIM database record ID 605657, and in cited publications numbered 75, 188 and 1941 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. GATA Binding Protein 3 (GATA3, Accession NM_002051) is another VGAM49 host target gene. GATA3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GATA3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GATA3 BINDING SITE, designated SEQ ID:893, to the nucleotide sequence of VGAM49 RNA, herein designated VGAM RNA,

also designated SEQ ID:384.

[1193] Another function of VGAM49 is therefore inhibition of GATA Binding Protein 3 (GATA3, Accession NM_002051). Accordingly, utilities of VGAM49 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GATA3. GDP Dissociation Inhibitor 2 (GDI2, Accession NM_001494) is another VGAM49 host target gene. GDI2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by GDI2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GDI2 BINDING SITE, designated SEQ ID:832, to the nucleotide sequence of VGAM49 RNA, herein designated VGAM RNA, also designated SEQ ID:384.

[1194] Another function of VGAM49 is therefore inhibition of GDP Dissociation Inhibitor 2 (GDI2, Accession NM_001494), a gene which regulates the gdp/gtp exchange reaction of most rab proteins by inhibiting the dissociation of gdp from them, and the subsequent binding of gtp to them. Accordingly, utilities of VGAM49 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GDI2. The function of GDI2 has been es-

established by previous studies. Various rab GDI-beta (RABGDIB) genes have been identified in a variety of species. It is a member of the GDP-dissociation inhibitor family, which includes GDI-alpha (RABGDIA; 300104). Shisheva et al. (1994) cloned mouse RABGDIB (which they referred to as 'smg p25A GDI') and reported the sequence. Sedlacek et al. (1995) found that the human RABGDIB sequence is 86.5% similar to RABGDIA, which they referred to as 'XAP-4.' Bachner et al. (1995) studied expression patterns of the 2 human genes. They showed that the 2.5-kb mRNA for RABGDIB is ubiquitously expressed, in contrast to RABGDIA, which is expressed primarily in neural and sensory tissues. By in situ hybridization, Sedlacek et al. (1998) demonstrated that the GDI2 gene maps to 10p15; a processed pseudogene mapped to 7p13-p11.

[1195] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[1196] Sedlacek, Z.; Munstermann, E.; Mincheva, A.; Lichter, P.; Poustka, A. : The human rab GDI beta gene with long retroposon-rich introns maps to 10p15 and its pseudogene to 7p11-p13. Mammalian Genome 9: 78-80, 1998. ; and

- [1198] Further studies establishing the function and utilities of GDI2 are found in John Hopkins OMIM database record ID 600767, and in cited publications numbered 1992, 2166–216 and 2030 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Huntingtin (Huntington disease) (HD, Accession NM_002111) is another VGAM49 host target gene. HD BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HD, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HD BINDING SITE, designated SEQ ID:899, to the nucleotide sequence of VGAM49 RNA, herein designated VGAM RNA, also designated SEQ ID:384.
- [1199] Another function of VGAM49 is therefore inhibition of Huntingtin (Huntington disease) (HD, Accession NM_002111). Accordingly, utilities of VGAM49 include diagnosis, prevention and treatment of diseases and clinical

conditions associated with HD. 5-hydroxytryptamine (serotonin) Receptor 2C (HTR2C, Accession NM_000868) is another VGAM49 host target gene. HTR2C BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HTR2C, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HTR2C BINDING SITE, designated SEQ ID:781, to the nucleotide sequence of VGAM49 RNA, herein designated VGAM RNA, also designated SEQ ID:384.

[1200] Another function of VGAM49 is therefore inhibition of 5-hydroxytryptamine (serotonin) Receptor 2C (HTR2C, Accession NM_000868), a gene which activates phospholipase C and regulates intracellular calcium flux. Accordingly, utilities of VGAM49 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HTR2C. The function of HTR2C has been established by previous studies. Hall (1947) found that DBA/2 mice exhibited genetic susceptibility to audiogenic seizures (AGSs) stimulated by a doorbell mounted in an iron tub. Thereafter, audiogenic seizures were among the intensively studied phenotypes in behavioral genetics.

Brennan et al. (1997) found that null mutant mice lacking serotonin 5-HT_{2C} receptors are extremely susceptible to AGSs. The onset of susceptibility was between 2 and 3 months of age, with complete penetrance in adult animals. Heisler et al. (2002) hypothesized that 5-HT receptors are expressed in POMC (OMIM Ref. No. 176830) neurons and that action at these receptors mediates a component of the anorexic effect of d-FEN (D-fenfluramine). Heisler et al. (2002) found that up to 80% of alpha-MSH neurons express HTR2C mRNA and that the pattern of co-expression was greatest in the caudal arcuate nucleus of the hypothalamus. Heisler et al. (2002) demonstrated that direct activation of HTR2C by agonist in rats decreased their food intake and showed increased induction of FOS-like immunoreactivity in a pattern persistent with d-FEN-induced FOS-like immunoreactivity expression in the arcuate nucleus and paraventricular nucleus of the hypothalamus. Heisler et al. (2002) demonstrated that d-FEN directly activates POMC neurons, indicating that central 5-HT systems directly activate POMC neurons.

[1201] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

- [1202] Heisler, L. K.; Cowley, M. A.; Tecott, L. H.; Fan, W.; Low, M. J.; Smart, J. L.; Rubinstein, M.; Tatro, J. B.; Marcus, J. N.; Holstege, H.; Lee, C. E.; Cone, R. D.; Elmquist, J. K. : Activation of central melanocortin pathways by fenfluramine. Science 297: 609–611, 2002. ; and

- [1204] Further studies establishing the function and utilities of HTR_{2C} are found in John Hopkins OMIM database record ID 312861, and in cited publications numbered 2426–242 and 2659–2431 listed in the bibliography section herein–below, which are also hereby incorporated by reference. LGR6 (Accession XM_097508) is another VGAM49 host target gene. LGR6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LGR6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LGR6 BINDING SITE, designated SEQ ID:3302, to the nucleotide sequence of VGAM49 RNA, herein designated VGAM RNA, also designated SEQ

ID:384.

[1205] Another function of VGAM49 is therefore inhibition of LGR6 (Accession XM_097508). Accordingly, utilities of VGAM49 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LGR6. Low Density Lipoprotein Receptor-related Protein 8, Apolipoprotein E Receptor (LRP8, Accession NM_033300) is another VGAM49 host target gene. LRP8 BINDING SITE1 and LRP8 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by LRP8, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LRP8 BINDING SITE1 and LRP8 BINDING SITE2, designated SEQ ID:2326 and SEQ ID:1139 respectively, to the nucleotide sequence of VGAM49 RNA, herein designated VGAM RNA, also designated SEQ ID:384.

[1206] Another function of VGAM49 is therefore inhibition of Low Density Lipoprotein Receptor-related Protein 8, Apolipoprotein E Receptor (LRP8, Accession NM_033300), a gene which binds vldl and transports it into cells by endocytosis. Accordingly, utilities of VGAM49 include diagnosis, prevention and treatment of diseases and clinical

conditions associated with LRP8. The function of LRP8 has been established by previous studies. Apolipoprotein E (APOE; 107741) is a 34-kD lipophilic protein that mediates high-affinity binding of APOE-containing lipoproteins to the low density lipoprotein receptor (see OMIM Ref. No. LDLR; 606945) and the very low density lipoprotein receptor (VLDLR; 192977). By screening a human placenta cDNA library with degenerate oligonucleotides based on a highly conserved region between LDLR and VLDLR, Kim et al. (1996) identified a cDNA encoding APOE receptor-2 (OMIM Ref. No. APOER2). The predicted 963-amino acid protein contains a putative 41-amino acid signal sequence and 5 functional domains that resemble those of LDLR and VLDLR. APOER2 appears specific for APOE-containing ligands: LDLR-deficient mammalian cells expressing APOER bound APOE-rich beta-VLDL with high affinity, but bound LDL and VLDL with much lower affinities. Northern blot analysis revealed that APOER2 is expressed as 4.5- and 8.5-kb mRNAs in brain and placenta. Kim et al. (1997) reported that the APOER2 gene contains 19 exons and spans approximately 60 kb. Alternative splicing generates multiple transcripts encoding receptors with different numbers of cysteine-rich repeats in the lig-

and-binding domain

- [1207] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

- [1210] Further studies establishing the function and utilities of LRP8 are found in John Hopkins OMIM database record ID 602600, and in cited publications numbered 2266-188 and 2267 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Macrophage Scavenger Receptor 1 (MSR1, Accession NM_002445) is another VGAM49 host target gene. MSR1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MSR1, corre-

sponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MSR1 BINDING SITE, designated SEQ ID:929, to the nucleotide sequence of VGAM49 RNA, herein designated VGAM RNA, also designated SEQ ID:384.

[1211] Another function of VGAM49 is therefore inhibition of Macrophage Scavenger Receptor 1 (MSR1, Accession NM_002445), a gene which plays a role in endocytosis of macromolecules. Accordingly, utilities of VGAM49 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MSR1. The function of MSR1 has been established by previous studies. Deletions on 8p23–p22 in prostate cancer cells (Latil and Lidereau, 1998) and linkage studies in families affected with hereditary prostate cancer (Xu et al., 2001) have implicated this region in the development of prostate cancer. The MSR1 gene is located at 8p22 and functions in several processes proposed to be relevant to prostate carcinogenesis. In studies of families affected with hereditary prostate cancer, Xu et al. (2002) identified 6 missense mutations and 1 nonsense mutation in the MSR1 gene. A family-based linkage and association test indicated that these muta–

tions cosegregate with prostate cancer ($P = 0.0007$). In addition, among men of European descent, MSR1 mutations were detected in 4.4% of individuals affected with nonhereditary prostate cancer as compared with 0.8% of unaffected men ($P = 0.009$). Among African American men, these values were 12.5% and 1.8%, respectively ($P = 0.01$). These results showed that MSR1 may be important in susceptibility to prostate cancer in men of both African American and European descent.

[1212] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[1213] Emi, M.; Asaoka, H.; Matsumoto, A.; Itakura, H.; Kurihara, Y.; Wada, Y.; Kanamori, H.; Yazaki, Y.; Takahashi, E.; Lepert, M.; Lalouel, J.-M.; Kodama, T.; Mukai, T. : Structure, organization, and chromosomal mapping of the human macrophage scavenger receptor gene. *J. Biol. Chem.* 268: 2120–2125, 1993. ; and

[1214] Latil, A.; Lidereau, R. : Genetic aspects of prostate cancer. *Virchows Arch.* 432: 389–406, 1998.

[1215] Further studies establishing the function and utilities of MSR1 are found in John Hopkins OMIM database record ID 153622, and in cited publications numbered 2689–2693

listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Protocadherin 11 X-linked (PCDH11X, Accession NM_032968) is another VGAM49 host target gene. PCDH11X BINDING SITE1 and PCDH11X BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PCDH11X, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDH11X BINDING SITE1 and PCDH11X BINDING SITE2, designated SEQ ID:2299 and SEQ ID:2301 respectively, to the nucleotide sequence of VGAM49 RNA, herein designated VGAM RNA, also designated SEQ ID:384.

[1216] Another function of VGAM49 is therefore inhibition of Protocadherin 11 X-linked (PCDH11X, Accession NM_032968), a gene which is thought to play a fundamental role in cell-cell recognition essential for the segmental development and function of the central nervous system. Accordingly, utilities of VGAM49 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDH11X. The function of PCDH11X has been established by previous studies. The

protocadherins are a subfamily of calcium-dependent cell adhesion and recognition proteins of the cadherin superfamily. They are particularly prevalent in the central nervous system. By database searching with a human PCDH7 (OMIM Ref. No. 602988) cDNA probe, Yoshida and Sugano (1999) identified a homologous mRNA from infant brain. They found the same sequence on a genomic clone of chromosome X, within the X-Y homology region at Xp21.3. By RT-PCR using fetal brain, they identified a cDNA, PCDH11, which they called PCDHX, encoding a deduced 1,021-amino acid protein. Sequence analysis predicted a 25-amino acid signal peptide, an extracellular portion with 7 cadherin repeats, a 24-amino acid transmembrane stretch, and a 10-amino acid cytoplasmic domain with homology to PCDH1 (OMIM Ref. No. 603626) and PCDH7. Yoshida and Sugano (1999) also identified a splice variant, termed PCDHXb, by EST database searches. Northern blot analysis revealed expression of an approximately 6.0-kb transcript in human and mouse fetal brain. Using STS analysis, Yoshida and Sugano (1999) mapped the PCDH11 gene to the X-Y homology region at chromosome Xq21.3 that is homologous to Yp11.1. Blanco et al. (2000) mapped the PCDH11 gene to Xq21.3, within the X-

Y homologous region, using detailed YAC and PAC contigs and fine STS marker order.

[1217] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[1218] Yoshida, K.; Sugano, S. : Identification of a novel proto-cadherin gene (PCDH11) on the human XY homology region in Xq21.3. Genomics 62: 540–543, 1999. ; and

[1219] Yoshida, K.; Sugano, S. : Identification of a novel proto-cadherin gene (PCDH11) on the human XY homology region in Xq21.3. Genomics 62: 540–543, 1999.

[1220] Further studies establishing the function and utilities of PCDH11X are found in John Hopkins OMIM database record ID 300246, and in cited publications numbered 2059–2064 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Protein-L-isoaspartate (D-aspartate) O-methyltransferase (PCMT1, Accession NM_005389) is another VGAM49 host target gene. PCMT1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PCMT1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of PCMT1 BINDING SITE, designated SEQ ID:1205, to the nucleotide sequence of VGAM49 RNA, herein designated VGAM RNA, also designated SEQ ID:384.

[1221] Another function of VGAM49 is therefore inhibition of Protein-L-isoaspartate (D-aspartate) O-methyltransferase (PCMT1, Accession NM_005389), a gene which catalyzes the methyl esterification of l-isoaspartyl and d-aspartyl residues in peptides and proteins . Accordingly, utilities of VGAM49 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCMT1. The function of PCMT1 has been established by previous studies. Three classes of protein carboxyl methyltransferases, distinguished by their methyl-acceptor substrate specificity, have been found in prokaryotic and eukaryotic cells. The type II enzyme catalyzes the transfer of a methyl group from S-adenosyl-L-methionine to the free carboxyl groups of D-aspartyl and L-isoaspartyl residues. These methyl-accepting residues result from the spontaneous deamidation, isomerization, and racemization of normal L-aspartyl and L-asparaginyl residues and represent sites of covalent damage to aging proteins PCMT1 (EC 2.1.1.77) is a protein repair enzyme that initiates the conversion of

abnormal D-aspartyl and L-isoaspartyl residues to the normal L-aspartyl form. L-isoaspartyl-D-aspartyl methyltransferase is a cytosolic monomer of about 25 kD. In-grosso et al. (1991) and MacLaren et al. (1992) showed that 2 major isozymes of this transferase result by alternative splicing of a single gene product. Animal model experiments lend further support to the function of PCMT1. Kim et al. (1999) developed Pcmt1 null mice. These mice manifested 2 phenotypes, a fatal seizure disorder and retarded growth. Continuous electroencephalogram monitoring of Pcmt1 null mice revealed that abnormal cortical activity occurred for about half of each 24-hour period, even in mice that had no visible evidence of convulsions. Antiepileptic therapy mitigated but did not eliminate the seizure disorder. It did, however, normalize the growth of Pcmt1 null mice, suggesting that the growth retardation was due to seizures rather than a global disturbance in growth at the cellular level. Consistent with this, the growth rate of Pcmt1 null fibroblasts was indistinguishable from that of wildtype fibroblasts.

[1222] It is appreciated that the abovementioned animal model for PCMT1 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appre-

ciated from the publications sited hereinbelow.

- [1223] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:
- [1224] MacLaren, D. C.; Kagan, R. M.; Clarke, S. : Alternative splicing of the human isoaspartyl protein carboxyl methyltransferase leads to the generation of a C-terminal -RDEL sequence in isozyme II. *Biochem. Biophys. Res. Commun.* 185: 277–283, 1992. ; and
- [1225] Kim et al. (1999) developed Pcmt1 null mice. These mice manifested 2 phenotypes, a fatal seizure disorder and retarded growth. Continuous electroencephalogram monitoring of Pcmt1 null mice.
- [1226] Further studies establishing the function and utilities of PCMT1 are found in John Hopkins OMIM database record ID 176851, and in sited publications numbered 1237–1244 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Proliferating Cell Nuclear Antigen (PCNA, Accession NM_002592) is another VGAM49 host target gene. PCNA BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PCNA, corresponding to a HOST TARGET binding site such as BINDING

SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCNA BINDING SITE, designated SEQ ID:939, to the nucleotide sequence of VGAM49 RNA, herein designated VGAM RNA, also designated SEQ ID:384.

[1227] Another function of VGAM49 is therefore inhibition of Proliferating Cell Nuclear Antigen (PCNA, Accession NM_002592), a gene which is involved in the control of eukaryotic dna replication by increasing the polymerase's processibility during elongation of the leading strand. Accordingly, utilities of VGAM49 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCNA. The function of PCNA has been established by previous studies. Proliferating cell nuclear antigen was originally identified by immunofluorescence as a nuclear protein whose appearance correlated with the proliferative state of the cell. A cell cycle-dependent protein described by Bravo (1986) and called cyclin was shown to be identical to PCNA. PCNA is required for replication of SV40 DNA in vitro and has been identified as the auxiliary protein (cofactor) for DNA polymerase delta (OMIM Ref. No. 174761). Unlike DNA polymerases alpha (OMIM Ref. No. 312040), beta (OMIM Ref. No. 174760),

and gamma (OMIM Ref. No. 174763), DNA polymerase delta has exonuclease activity. Since the exonuclease activity is in the 3-prime-to-5-prime direction, DNA polymerase delta has a proofreading activity and is expected to play a significant role in the maintenance of the fidelity of mammalian DNA replication. The protein has been highly conserved during evolution; the deduced amino acid sequences of rat and human differ by only 4 out of 261 amino acids. The human anti-PCNA autoantibodies react not only with the nuclei of proliferating cells of all experimental animals so far examined but also with the nuclei of plant cells. Suzuka et al. (1989) demonstrated the presence of the PCNA/cyclin-related genes in higher plants. It had been speculated that genetic engineering could improve the long-term function of vascular grafts that are prone to atherosclerosis and occlusion. Mann et al. (1995) showed that an 'intraoperative gene therapy approach' using antisense oligodeoxynucleotides to block medial smooth muscle cell proliferation can prevent the accelerated atherosclerosis that is responsible for autologous vein graft failure. Selective prevention of the expression of genes for 2 cell cycle regulatory proteins, proliferating cell nuclear antigen and cell division cycle kinase 2

(CDK2; 116953), was achieved in the smooth muscle cells of rabbit jugular veins grafted into the carotid arteries. This alteration of gene expression successfully redirected vein graft biology away from neointimal hyperplasia and toward medial hypertrophy, yielding conduits that more closely resembled normal arteries. Furthermore, the genetically engineered grafts proved resistant to diet-induced atherosclerosis.

[1228] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[1229] Bravo, R. : Synthesis of the nuclear protein cyclin (PCNA) and its relationship with DNA replication. Exp. Cell Res. 163: 287–293, 1986. ; and

[1231] Further studies establishing the function and utilities of PCNA are found in John Hopkins OMIM database record ID 176740, and in cited publications numbered 374–383 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Proline Arginine–

rich End Leucine-rich Repeat Protein (PRELP, Accession NM_002725) is another VGAM49 host target gene. PRELP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PRELP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRELP BINDING SITE, designated SEQ ID:950, to the nucleotide sequence of VGAM49 RNA, herein designated VGAM RNA, also designated SEQ ID:384.

[1232] Another function of VGAM49 is therefore inhibition of Proline Arginine-rich End Leucine-rich Repeat Protein (PRELP, Accession NM_002725), a gene which is a connective tissue glycoprotein of the leucine-rich-repeat (LRR) family. Accordingly, utilities of VGAM49 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRELP. The function of PRELP has been established by previous studies. PRELP (proline arginine-rich end leucine-rich repeat protein) is a connective tissue glycoprotein of the leucine-rich-repeat (LRR) family. The LRR motif is believed to participate in protein-protein interactions; Bengtsson et al. (1995) stated that this motif is found in several matrix-binding proteins.

Bengtsson et al. (1995) isolated the 58-kD PRELP protein from bovine articular cartilage and cloned the human PRELP cDNA from an articular chondrocyte cDNA library. Sequencing revealed that the gene encodes a 382-amino acid polypeptide with a calculated molecular mass of 42 kD. The protein sequence contains a putative secretory signal sequence, 10 leucine-rich repeats, several glycosylation sites, and a proline- and arginine-rich N-terminus. They reported that the protein sequence was 36% similar to fibromodulin (OMIM Ref. No. 600245) and 33% similar to bovine lumican (see OMIM Ref. No. 600616). Grover et al. (1996) characterized the expression pattern and genomic structure of human PRELP. They determined that PRELP is encoded by messages of 1.7, 4.6, and 6.7 kb, in descending order of expression level. The messages are abundant in juvenile and adult cartilage, but not present in neonatal cartilage nor in cultured fibroblasts. Among other adult tissues, PRELP is expressed in lung. Grover et al. (1996) reported that the PRELP gene contains 2 introns. They mapped the gene to human chromosome 1q32; interestingly, the fibromodulin gene also resides at this location.

[1233] Full details of the abovementioned studies are described

in the following publications, the disclosure of which are hereby incorporated by reference:

- [1234] Bengtsson, E.; Neame, P. J.; Heinegard, D.; Sommarin, Y. : The primary structure of a basic leucine-rich repeat protein, PRELP, found in connective tissues. J. Biol. Chem. 270: 25639–25644, 1995. ; and
- [1235] Grover, J.; Chen, X.-N.; Korenberg, J. R.; Recklies, A. D.; Roughley, P. J. : The gene organization, chromosome location, and expression of a 55-kDa matrix protein (PRELP) of human art.
- [1236] Further studies establishing the function and utilities of PRELP are found in John Hopkins OMIM database record ID 601914, and in cited publications numbered 2057–2058 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Parathymosin (PTMS, Accession NM_002824) is another VGAM49 host target gene. PTMS BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PTMS, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PTMS BINDING SITE, designated SEQ ID:958, to the nucleotide sequence of VGAM49 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:384.

[1237] Another function of VGAM49 is therefore inhibition of Parathymosin (PTMS, Accession NM_002824), a gene which is involved in the regulation of cellular immunity. Accordingly, utilities of VGAM49 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTMS. The function of PTMS and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM48. Solute Carrier Family 4, Sodium Bicarbonate Cotransporter, Member 4 (SLC4A4, Accession NM_003759) is another VGAM49 host target gene. SLC4A4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC4A4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC4A4 BINDING SITE, designated SEQ ID:1054, to the nucleotide sequence of VGAM49 RNA, herein designated VGAM RNA, also designated SEQ ID:384.

[1238] Another function of VGAM49 is therefore inhibition of Solute Carrier Family 4, Sodium Bicarbonate Cotransporter,

Member 4 (SLC4A4, Accession NM_003759), a gene which is a sodium bicarbonate cotransporter. Accordingly, utilities of VGAM49 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC4A4. The function of SLC4A4 has been established by previous studies. By screening a human heart cDNA library with rat kidney NBC cDNAs, followed by a PCR approach, Choi et al. (1999) isolated a full-length cDNA encoding a heart NBC, which they called hhNBC. They reported that the coding sequence of hhNBC is identical to that of pNBC (Abuladze et al., 1998). However, the 5-prime untranslated regions of hhNBC and pNBC differ. Northern blot analysis using the 5-prime region of the hhNBC coding sequence as probe detected an approximately 9-kb transcript that was strongly expressed in pancreas and weakly expressed in heart and brain. Choi et al. (1999) found that both hhNBC and kNBC (Burnham et al., 1997), when expressed in *Xenopus*, are electrogenic. Soleimani and Burnham (2000) stated that kNBC (Burnham et al., 1997) and pNBC (Abuladze et al., 1998) are encoded by splice variants of the same gene, SLC4A4, which they called NBC1. Mutations in the SLC4A4 gene (e.g., 603345.0001, 603345.0002) cause proximal renal tubular acidosis with

bilateral glaucoma, cataracts, and band keratopathy (OMIM Ref. No. 604278). Such mutations may increase the bicarbonate concentration in the corneal stroma, which would facilitate calcium deposition leading to band keratopathy. Igarashi et al. (1999) suggested that the kidney and pancreatic NBCs are derived from a common gene by alternative splicing and that mutations at the common region would inactivate both isoforms. Studies by Usui et al. (1999) confirmed that both kidney and pancreatic NBC are involved in the transport of sodium and bicarbonate out of the corneal stroma and into the aqueous humor.

[1239] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[1240] Soleimani, M.; Burnham, C. E. : Physiologic and molecular aspects of the $\text{Na}(+):\text{HCO}_3(-)$ cotransporter in health and disease processes. *Kidney Int.* 57: 371–384, 2000. ; and

[1241] Choi, I.; Romero, M. F.; Khandoudi, N.; Bril, A.; Boron, W. F. : Cloning and characterization of a human electrogenic $\text{Na}(+)-\text{HCO}_3(-)$ cotransporter isoform (hhNBC). *Am. J. Physiol.* 276: C57.

[1242] Further studies establishing the function and utilities of SLC4A4 are found in John Hopkins OMIM database record

ID 603345, and in cited publications numbered 1815–1821 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Trichorhinophalangeal Syndrome I (TRPS1, Accession NM_014112) is another VGAM49 host target gene. TRPS1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by TRPS1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRPS1 BINDING SITE, designated SEQ ID:1471, to the nucleotide sequence of VGAM49 RNA, herein designated VGAM RNA, also designated SEQ ID:384.

[1243] Another function of VGAM49 is therefore inhibition of Trichorhinophalangeal Syndrome I (TRPS1, Accession NM_014112), a gene which may function as a transcriptional activator protein. Accordingly, utilities of VGAM49 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRPS1. The function of TRPS1 has been established by previous studies. Trichorhinophalangeal syndrome type I (OMIM Ref. No. 190350) is a malformation syndrome characterized by distinctive craniofacial and skeletal abnormalities and is

inherited as an autosomal dominant. TRPS I patients have sparse scalp hair, bulbous tip of the nose, long flat philtrum, thin upper vermilion border, and protruding ears. Skeletal abnormalities include cone-shaped epiphyses at the phalanges, hip malformations, and short stature. Ludecke et al. (1995) and Hou et al. (1995) assigned the TRPS1 gene to 8q24. It maps centromeric to the gene that is mutant in multiple exostoses type I (EXT1; 133700); EXT1 is deleted in all patients with TRPS type II, or Langer-Giedion syndrome (OMIM Ref. No. 150230), which combines features of TRPS I and multiple exostoses. Momeni et al. (2000) positionally cloned a gene that spanned the chromosomal breakpoint in 2 patients with TRPS I and was deleted in 5 patients with TRPS I associated with an interstitial deletion. Northern blot analyses revealed transcripts of 7 and 10.5 kb. The gene, designated TRPS1, has 7 exons and encodes a polypeptide of 1,281 amino acids. The predicted protein sequence has 2 potential nuclear localization signals and an unusual combination of different zinc finger motifs, including IKAROS-like (see OMIM Ref. No. 603023) and GATA-binding (see OMIM Ref. No. 600576) sequences. Momeni et al. (2000) identified 6 different nonsense mutations in 10 unrelated

patients. The findings suggested that haploinsufficiency for this putative transcription factor causes TRPS I. To investigate whether trichorhinophalangeal syndrome type III (OMIM Ref. No. 190351) is caused by TRPS1 mutations and to establish a genotype–phenotype correlation in TRPS, Ludecke et al. (2001) performed extensive mutation analysis and evaluated height and degree of brachydactyly in patients with TRPS I or TRPS III. They found 35 different mutations in 44 of 51 unrelated patients. The detection rate (86%) indicated that TRPS1 is the major locus for TRPS I and TRPS III. They found no mutation in the parents of sporadic patients or in apparently healthy relatives of familial patients, indicating complete penetrance of TRPS1 mutations. Evaluation of skeletal abnormalities of patients with TRPS1 mutations revealed a wide clinical spectrum. The phenotype was variable in unrelated, age– and sex–matched patients with identical mutations, as well as in families. Four of the 5 missense mutations altered the GATA DNA–binding zinc finger, and 6 of the 7 unrelated patients with these mutations could be classified as having TRPS III, because they had severe bradycardia, due to short metacarpals, and severe short stature. The data indicated that TRPS III is at the severe end of the TRPS spec–

trum and that it is most often caused by a specific class of mutations in exon 6 the TRPS1 gene. In the study of Ludecke et al. (2001), 5 mutations were recurrent, and 4 of these were identified in patients of different ethnicities: 1 in patients of Norwegian, Turkish, and Belgian extraction, and another in patients of Belgian, Turkish, and Japanese extraction, for example.

[1244] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[1245] Momeni, P.; Glockner, G.; Schmidt, O.; von Holtum, D.; Albrecht, B.; Gillessen-Kaesbach, G.; Hennekam, R.; Meinecke, P.; Zabel, B.; Rosenthal, A.; Horsthemke, B.; Ludecke, H.-J. : Mutations in a new gene, encoding a zinc-finger protein, cause tricho-rhino-phalangeal syndrome type I. [1247] Further studies establishing the function and utilities of TRPS1 are found in John Hopkins OMIM database record ID 604386, and in cited publications numbered

1620–1621, 855, 1814, 305 and 3044 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. ARS2 (Accession NM_015908) is another VGAM49 host target gene. ARS2 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by ARS2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARS2 BINDING SITE, designated SEQ ID:1650, to the nucleotide sequence of VGAM49 RNA, herein designated VGAM RNA, also designated SEQ ID:384.

[1248] Another function of VGAM49 is therefore inhibition of ARS2 (Accession NM_015908). Accordingly, utilities of VGAM49 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARS2. Bromodomain Containing 4 (BRD4, Accession NM_058243) is another VGAM49 host target gene. BRD4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by BRD4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

BRD4 BINDING SITE, designated SEQ ID:2368, to the nucleotide sequence of VGAM49 RNA, herein designated VGAM RNA, also designated SEQ ID:384.

[1249] Another function of VGAM49 is therefore inhibition of Bromodomain Containing 4 (BRD4, Accession NM_058243). Accordingly, utilities of VGAM49 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BRD4. CAPN13 (Accession NM_144575) is another VGAM49 host target gene. CAPN13 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CAPN13, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CAPN13 BINDING SITE, designated SEQ ID:2485, to the nucleotide sequence of VGAM49 RNA, herein designated VGAM RNA, also designated SEQ ID:384.

[1250] Another function of VGAM49 is therefore inhibition of CAPN13 (Accession NM_144575). Accordingly, utilities of VGAM49 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CAPN13. Cat Eye Syndrome Chromosome Region, Candidate 6

(CECR6, Accession NM_031890) is another VGAM49 host target gene. CECR6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CECR6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CECR6 BINDING SITE, designated SEQ ID:2218, to the nucleotide sequence of VGAM49 RNA, herein designated VGAM RNA, also designated SEQ ID:384.

[1251] Another function of VGAM49 is therefore inhibition of Cat Eye Syndrome Chromosome Region, Candidate 6 (CECR6, Accession NM_031890). Accordingly, utilities of VGAM49 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CECR6. DK-FZP434I0714 (Accession XM_098247) is another VGAM49 host target gene. DKFZP434I0714 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DKFZP434I0714, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DK-FZP434I0714 BINDING SITE, designated SEQ ID:3362, to

the nucleotide sequence of VGAM49 RNA, herein designated VGAM RNA, also designated SEQ ID:384.

[1252] Another function of VGAM49 is therefore inhibition of DKFZP434I0714 (Accession XM_098247). Accordingly, utilities of VGAM49 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434I0714. DKFZP564G092 (Accession NM_015601) is another VGAM49 host target gene. DKFZP564G092 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DKFZP564G092, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP564G092 BINDING SITE, designated SEQ ID:1639, to the nucleotide sequence of VGAM49 RNA, herein designated VGAM RNA, also designated SEQ ID:384.

[1253] Another function of VGAM49 is therefore inhibition of DKFZP564G092 (Accession NM_015601). Accordingly, utilities of VGAM49 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP564G092. DKFZp564K142 (Accession NM_032121) is another VGAM49 host target gene. DKFZp564K142

BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZp564K142, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp564K142 BINDING SITE, designated SEQ ID:2231, to the nucleotide sequence of VGAM49 RNA, herein designated VGAM RNA, also designated SEQ ID:384.

[1254] Another function of VGAM49 is therefore inhibition of DKFZp564K142 (Accession NM_032121). Accordingly, utilities of VGAM49 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp564K142. DKFZp566D234 (Accession XM_030162) is another VGAM49 host target gene. DKFZp566D234 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZp566D234, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp566D234 BINDING SITE, designated SEQ ID:2612, to the nucleotide sequence of VGAM49 RNA, herein designated VGAM RNA, also desig-

nated SEQ ID:384.

[1255] Another function of VGAM49 is therefore inhibition of DKFZp566D234 (Accession XM_030162). Accordingly, utilities of VGAM49 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp566D234. DKFZP566I1024 (Accession XM_046506) is another VGAM49 host target gene. DKFZP566I1024 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP566I1024, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP566I1024 BINDING SITE, designated SEQ ID:2878, to the nucleotide sequence of VGAM49 RNA, herein designated VGAM RNA, also designated SEQ ID:384.

[1256] Another function of VGAM49 is therefore inhibition of DKFZP566I1024 (Accession XM_046506). Accordingly, utilities of VGAM49 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP566I1024. EPI64 (Accession XM_170997) is another VGAM49 host target gene. EPI64 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region

of mRNA encoded by EPI64, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EPI64 BINDING SITE, designated SEQ ID:3681, to the nucleotide sequence of VGAM49 RNA, herein designated VGAM RNA, also designated SEQ ID:384.

[1257] Another function of VGAM49 is therefore inhibition of EPI64 (Accession XM_170997). Accordingly, utilities of VGAM49 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EPI64. FLJ00012 (Accession XM_058426) is another VGAM49 host target gene. FLJ00012 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ00012, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ00012 BINDING SITE, designated SEQ ID:2985, to the nucleotide sequence of VGAM49 RNA, herein designated VGAM RNA, also designated SEQ ID:384.

[1258] Another function of VGAM49 is therefore inhibition of FLJ00012 (Accession XM_058426). Accordingly, utilities of

VGAM49 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ00012. FLJ10460 (Accession NM_018097) is another VGAM49 host target gene. FLJ10460 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ10460, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10460 BINDING SITE, designated SEQ ID:1778, to the nucleotide sequence of VGAM49 RNA, herein designated VGAM RNA, also designated SEQ ID:384.

[1259] Another function of VGAM49 is therefore inhibition of FLJ10460 (Accession NM_018097). Accordingly, utilities of VGAM49 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10460. FLJ10687 (Accession NM_018178) is another VGAM49 host target gene. FLJ10687 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ10687, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10687 BINDING SITE,

designated SEQ ID:1793, to the nucleotide sequence of VGAM49 RNA, herein designated VGAM RNA, also designated SEQ ID:384.

[1260] Another function of VGAM49 is therefore inhibition of FLJ10687 (Accession NM_018178). Accordingly, utilities of VGAM49 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10687. FLJ10738 (Accession NM_018199) is another VGAM49 host target gene. FLJ10738 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10738, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10738 BINDING SITE, designated SEQ ID:1799, to the nucleotide sequence of VGAM49 RNA, herein designated VGAM RNA, also designated SEQ ID:384.

[1261] Another function of VGAM49 is therefore inhibition of FLJ10738 (Accession NM_018199). Accordingly, utilities of VGAM49 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10738. FLJ13158 (Accession NM_024909) is another VGAM49 host target gene. FLJ13158 BINDING SITE is HOST TARGET

binding site found in the 3' untranslated region of mRNA encoded by FLJ13158, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13158 BINDING SITE, designated SEQ ID:2109, to the nucleotide sequence of VGAM49 RNA, herein designated VGAM RNA, also designated SEQ ID:384.

[1262] Another function of VGAM49 is therefore inhibition of FLJ13158 (Accession NM_024909). Accordingly, utilities of VGAM49 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13158. FLJ20294 (Accession NM_017749) is another VGAM49 host target gene. FLJ20294 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ20294, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20294 BINDING SITE, designated SEQ ID:1747, to the nucleotide sequence of VGAM49 RNA, herein designated VGAM RNA, also designated SEQ ID:384.

[1263] Another function of VGAM49 is therefore inhibition of

FLJ20294 (Accession NM_017749). Accordingly, utilities of VGAM49 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20294. FLJ21657 (Accession NM_022483) is another VGAM49 host target gene. FLJ21657 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ21657, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21657 BINDING SITE, designated SEQ ID:1991, to the nucleotide sequence of VGAM49 RNA, herein designated VGAM RNA, also designated SEQ ID:384.

[1264] Another function of VGAM49 is therefore inhibition of FLJ21657 (Accession NM_022483). Accordingly, utilities of VGAM49 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21657. GT650 (Accession NM_052851) is another VGAM49 host target gene. GT650 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GT650, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of GT650 BINDING SITE, designated SEQ ID:2341, to the nucleotide sequence of VGAM49 RNA, herein designated VGAM RNA, also designated SEQ ID:384.

[1265] Another function of VGAM49 is therefore inhibition of GT650 (Accession NM_052851). Accordingly, utilities of VGAM49 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GT650. Hairy/enhancer-of-split Related with YRPW Motif 2 (HEY2, Accession NM_012259) is another VGAM49 host target gene. HEY2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HEY2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HEY2 BINDING SITE, designated SEQ ID:1420, to the nucleotide sequence of VGAM49 RNA, herein designated VGAM RNA, also designated SEQ ID:384.

[1266] Another function of VGAM49 is therefore inhibition of Hairy/enhancer-of-split Related with YRPW Motif 2 (HEY2, Accession NM_012259). Accordingly, utilities of VGAM49 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HEY2. Hyperme-

thylated In Cancer 2 (HIC2, Accession XM_036937) is another VGAM49 host target gene. HIC2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HIC2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HIC2 BINDING SITE, designated SEQ ID:2717, to the nucleotide sequence of VGAM49 RNA, herein designated VGAM RNA, also designated SEQ ID:384.

[1267] Another function of VGAM49 is therefore inhibition of Hypermethylated In Cancer 2 (HIC2, Accession XM_036937). Accordingly, utilities of VGAM49 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HIC2. HOOK3 (Accession NM_032410) is another VGAM49 host target gene. HOOK3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HOOK3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HOOK3 BINDING SITE, designated SEQ ID:2249, to the nucleotide sequence of VGAM49 RNA, herein designated VGAM RNA,

also designated SEQ ID:384.

[1268] Another function of VGAM49 is therefore inhibition of HOOK3 (Accession NM_032410). Accordingly, utilities of VGAM49 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HOOK3. Interleukin 1 Receptor Accessory Protein-like 1 (IL1RAPL1, Accession NM_014271) is another VGAM49 host target gene. IL1RAPL1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by IL1RAPL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IL1RAPL1 BINDING SITE, designated SEQ ID:1488, to the nucleotide sequence of VGAM49 RNA, herein designated VGAM RNA, also designated SEQ ID:384.

[1269] Another function of VGAM49 is therefore inhibition of Interleukin 1 Receptor Accessory Protein-like 1 (IL1RAPL1, Accession NM_014271). Accordingly, utilities of VGAM49 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IL1RAPL1. KALI (Accession NM_052931) is another VGAM49 host target gene. KALI BINDING SITE is HOST TARGET binding site

found in the 3` untranslated region of mRNA encoded by KALI, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KALI BINDING SITE, designated SEQ ID:2347, to the nucleotide sequence of VGAM49 RNA, herein designated VGAM RNA, also designated SEQ ID:384.

[1270] Another function of VGAM49 is therefore inhibition of KALI (Accession NM_052931). Accordingly, utilities of VGAM49 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KALI. KIAA0077 (Accession XM_040158) is another VGAM49 host target gene. KIAA0077 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0077, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0077 BINDING SITE, designated SEQ ID:2773, to the nucleotide sequence of VGAM49 RNA, herein designated VGAM RNA, also designated SEQ ID:384.

[1271] Another function of VGAM49 is therefore inhibition of KIAA0077 (Accession XM_040158). Accordingly, utilities

of VGAM49 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0077. KIAA0089 (Accession XM_046056) is another VGAM49 host target gene. KIAA0089 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0089, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0089 BINDING SITE, designated SEQ ID:2873, to the nucleotide sequence of VGAM49 RNA, herein designated VGAM RNA, also designated SEQ ID:384.

[1272] Another function of VGAM49 is therefore inhibition of KIAA0089 (Accession XM_046056). Accordingly, utilities of VGAM49 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0089. KIAA0286 (Accession XM_043118) is another VGAM49 host target gene. KIAA0286 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0286, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

KIAA0286 BINDING SITE, designated SEQ ID:2814, to the nucleotide sequence of VGAM49 RNA, herein designated VGAM RNA, also designated SEQ ID:384.

[1273] Another function of VGAM49 is therefore inhibition of KIAA0286 (Accession XM_043118). Accordingly, utilities of VGAM49 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0286. KIAA0295 (Accession XM_042833) is another VGAM49 host target gene. KIAA0295 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0295, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0295 BINDING SITE, designated SEQ ID:2808, to the nucleotide sequence of VGAM49 RNA, herein designated VGAM RNA, also designated SEQ ID:384.

[1274] Another function of VGAM49 is therefore inhibition of KIAA0295 (Accession XM_042833). Accordingly, utilities of VGAM49 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0295. KIAA0342 (Accession XM_047357) is another VGAM49 host target gene. KIAA0342 BINDING SITE is

HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0342, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0342 BINDING SITE, designated SEQ ID:2890, to the nucleotide sequence of VGAM49 RNA, herein designated VGAM RNA, also designated SEQ ID:384.

[1275] Another function of VGAM49 is therefore inhibition of KIAA0342 (Accession XM_047357). Accordingly, utilities of VGAM49 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0342. KIAA0564 (Accession XM_038664) is another VGAM49 host target gene. KIAA0564 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0564, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0564 BINDING SITE, designated SEQ ID:2743, to the nucleotide sequence of VGAM49 RNA, herein designated VGAM RNA, also designated SEQ ID:384.

[1276] Another function of VGAM49 is therefore inhibition of

KIAA0564 (Accession XM_038664). Accordingly, utilities of VGAM49 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0564. KIAA0630 (Accession XM_114729) is another VGAM49 host target gene. KIAA0630 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0630, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0630 BINDING SITE, designated SEQ ID:3465, to the nucleotide sequence of VGAM49 RNA, herein designated VGAM RNA, also designated SEQ ID:384.

[1277] Another function of VGAM49 is therefore inhibition of KIAA0630 (Accession XM_114729). Accordingly, utilities of VGAM49 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0630. KIAA0662 (Accession XM_088539) is another VGAM49 host target gene. KIAA0662 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0662, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of KIAA0662 BINDING SITE, designated SEQ ID:3215, to the nucleotide sequence of VGAM49 RNA, herein designated VGAM RNA, also designated SEQ ID:384.

[1278] Another function of VGAM49 is therefore inhibition of KIAA0662 (Accession XM_088539). Accordingly, utilities of VGAM49 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0662. KIAA0830 (Accession XM_045759) is another VGAM49 host target gene. KIAA0830 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0830, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0830 BINDING SITE, designated SEQ ID:2866, to the nucleotide sequence of VGAM49 RNA, herein designated VGAM RNA, also designated SEQ ID:384.

[1279] Another function of VGAM49 is therefore inhibition of KIAA0830 (Accession XM_045759). Accordingly, utilities of VGAM49 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0830. KIAA0964 (Accession NM_014902) is another

VGAM49 host target gene. KIAA0964 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0964, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0964 BINDING SITE, designated SEQ ID:1579, to the nucleotide sequence of VGAM49 RNA, herein designated VGAM RNA, also designated SEQ ID:384.

[1280] Another function of VGAM49 is therefore inhibition of KIAA0964 (Accession NM_014902). Accordingly, utilities of VGAM49 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0964. KIAA1076 (Accession XM_037523) is another VGAM49 host target gene. KIAA1076 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1076, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1076 BINDING SITE, designated SEQ ID:2723, to the nucleotide sequence of VGAM49 RNA, herein designated VGAM RNA, also designated SEQ ID:384.

[1281] Another function of VGAM49 is therefore inhibition of KIAA1076 (Accession XM_037523). Accordingly, utilities of VGAM49 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1076. KIAA1181 (Accession XM_043340) is another VGAM49 host target gene. KIAA1181 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1181, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1181 BINDING SITE, designated SEQ ID:2817, to the nucleotide sequence of VGAM49 RNA, herein designated VGAM RNA, also designated SEQ ID:384.

[1282] Another function of VGAM49 is therefore inhibition of KIAA1181 (Accession XM_043340). Accordingly, utilities of VGAM49 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1181. KIAA1319 (Accession NM_020770) is another VGAM49 host target gene. KIAA1319 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1319, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1319 BINDING SITE, designated SEQ ID:1925, to the nucleotide sequence of VGAM49 RNA, herein designated VGAM RNA, also designated SEQ ID:384.

[1283] Another function of VGAM49 is therefore inhibition of KIAA1319 (Accession NM_020770). Accordingly, utilities of VGAM49 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1319. KIAA1522 (Accession XM_036299) is another VGAM49 host target gene. KIAA1522 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1522, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1522 BINDING SITE, designated SEQ ID:2708, to the nucleotide sequence of VGAM49 RNA, herein designated VGAM RNA, also designated SEQ ID:384.

[1284] Another function of VGAM49 is therefore inhibition of KIAA1522 (Accession XM_036299). Accordingly, utilities of VGAM49 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA1522. KIAA1906 (Accession XM_055095) is another VGAM49 host target gene. KIAA1906 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1906, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1906 BINDING SITE, designated SEQ ID:2971, to the nucleotide sequence of VGAM49 RNA, herein designated VGAM RNA, also designated SEQ ID:384.

[1285] Another function of VGAM49 is therefore inhibition of KIAA1906 (Accession XM_055095). Accordingly, utilities of VGAM49 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1906. Mitogen-activated Protein Kinase 6 (MAPK6, Accession NM_002748) is another VGAM49 host target gene. MAPK6 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MAPK6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAPK6 BINDING SITE, designated SEQ ID:952, to the nucleotide sequence of VGAM49 RNA,

herein designated VGAM RNA, also designated SEQ ID:384.

[1286] Another function of VGAM49 is therefore inhibition of Mitogen-activated Protein Kinase 6 (MAPK6, Accession NM_002748). Accordingly, utilities of VGAM49 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAPK6. MGC13138 (Accession NM_033410) is another VGAM49 host target gene. MGC13138 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC13138, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC13138 BINDING SITE, designated SEQ ID:2332, to the nucleotide sequence of VGAM49 RNA, herein designated VGAM RNA, also designated SEQ ID:384.

[1287] Another function of VGAM49 is therefore inhibition of MGC13138 (Accession NM_033410). Accordingly, utilities of VGAM49 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC13138. MGC2742 (Accession NM_023938) is another VGAM49 host target gene. MGC2742 BINDING SITE is

HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MGC2742, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC2742 BINDING SITE, designated SEQ ID:2040, to the nucleotide sequence of VGAM49 RNA, herein designated VGAM RNA, also designated SEQ ID:384.

[1288] Another function of VGAM49 is therefore inhibition of MGC2742 (Accession NM_023938). Accordingly, utilities of VGAM49 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC2742. MGC32043 (Accession NM_144582) is another VGAM49 host target gene. MGC32043 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC32043, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC32043 BINDING SITE, designated SEQ ID:2486, to the nucleotide sequence of VGAM49 RNA, herein designated VGAM RNA, also designated SEQ ID:384.

[1289] Another function of VGAM49 is therefore inhibition of

MGC32043 (Accession NM_144582). Accordingly, utilities of VGAM49 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC32043. Nuclear Factor of Activated T-cells 5, Tonicity-responsive (NFAT5, Accession NM_138714) is another VGAM49 host target gene. NFAT5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NFAT5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NFAT5 BINDING SITE, designated SEQ ID:2452, to the nucleotide sequence of VGAM49 RNA, herein designated VGAM RNA, also designated SEQ ID:384.

[1290] Another function of VGAM49 is therefore inhibition of Nuclear Factor of Activated T-cells 5, Tonicity-responsive (NFAT5, Accession NM_138714). Accordingly, utilities of VGAM49 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NFAT5. Oxysterol Binding Protein-like 8 (OSBPL8, Accession NM_020841) is another VGAM49 host target gene. OSBPL8 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by OSBPL8, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OSBPL8 BINDING SITE, designated SEQ ID:1929, to the nucleotide sequence of VGAM49 RNA, herein designated VGAM RNA, also designated SEQ ID:384.

[1291] Another function of VGAM49 is therefore inhibition of Oxysterol Binding Protein-like 8 (OSBPL8, Accession NM_020841). Accordingly, utilities of VGAM49 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OSBPL8. RAB10, Member RAS Oncogene Family (RAB10, Accession XM_097979) is another VGAM49 host target gene. RAB10 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RAB10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAB10 BINDING SITE, designated SEQ ID:3337, to the nucleotide sequence of VGAM49 RNA, herein designated VGAM RNA, also designated SEQ ID:384.

[1292] Another function of VGAM49 is therefore inhibition of RAB10, Member RAS Oncogene Family (RAB10, Accession

XM_097979). Accordingly, utilities of VGAM49 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAB10. RAN Binding Protein 1 (RANBP1, Accession NM_002882) is another VGAM49 host target gene. RANBP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RANBP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RANBP1 BINDING SITE, designated SEQ ID:969, to the nucleotide sequence of VGAM49 RNA, herein designated VGAM RNA, also designated SEQ ID:384.

[1293] Another function of VGAM49 is therefore inhibition of RAN Binding Protein 1 (RANBP1, Accession NM_002882). Accordingly, utilities of VGAM49 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RANBP1. Ras Association (RalGDS/AF-6) Domain Family 2 (RASSF2, Accession NM_014737) is another VGAM49 host target gene. RASSF2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RASSF2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RASSF2 BINDING SITE, designated SEQ ID:1537, to the nucleotide sequence of VGAM49 RNA, herein designated VGAM RNA, also designated SEQ ID:384.

[1294] Another function of VGAM49 is therefore inhibition of Ras Association (RalGDS/AF-6) Domain Family 2 (RASSF2, Accession NM_014737). Accordingly, utilities of VGAM49 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RASSF2. Serine/threonine Kinase 22D (spermiogenesis associated) (STK22D, Accession NM_032028) is another VGAM49 host target gene. STK22D BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by STK22D, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of STK22D BINDING SITE, designated SEQ ID:2226, to the nucleotide sequence of VGAM49 RNA, herein designated VGAM RNA, also designated SEQ ID:384.

[1295] Another function of VGAM49 is therefore inhibition of Serine/threonine Kinase 22D (spermiogenesis associated)

(STK22D, Accession NM_032028). Accordingly, utilities of VGAM49 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STK22D. Synaptojanin 2 (SYNJ2, Accession XM_029746) is another VGAM49 host target gene. SYNJ2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SYNJ2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SYNJ2 BINDING SITE, designated SEQ ID:2606, to the nucleotide sequence of VGAM49 RNA, herein designated VGAM RNA, also designated SEQ ID:384.

[1296] Another function of VGAM49 is therefore inhibition of Synaptojanin 2 (SYNJ2, Accession XM_029746). Accordingly, utilities of VGAM49 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SYNJ2. TBLR1 (Accession NM_024665) is another VGAM49 host target gene. TBLR1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TBLR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TBLR1 BINDING SITE, designated SEQ ID:2607, to the nucleotide sequence of VGAM49 RNA, herein designated VGAM RNA, also designated SEQ ID:384.

tarity of the nucleotide sequences of TBLR1 BINDING SITE, designated SEQ ID:2079, to the nucleotide sequence of VGAM49 RNA, herein designated VGAM RNA, also designated SEQ ID:384.

[1297] Another function of VGAM49 is therefore inhibition of TBLR1 (Accession NM_024665). Accordingly, utilities of VGAM49 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TBLR1. Transmembrane 9 Superfamily Member 1 (TM9SF1, Accession NM_006405) is another VGAM49 host target gene. TM9SF1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TM9SF1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TM9SF1 BINDING SITE, designated SEQ ID:1296, to the nucleotide sequence of VGAM49 RNA, herein designated VGAM RNA, also designated SEQ ID:384.

[1298] Another function of VGAM49 is therefore inhibition of Transmembrane 9 Superfamily Member 1 (TM9SF1, Accession NM_006405). Accordingly, utilities of VGAM49 include diagnosis, prevention and treatment of diseases and

clinical conditions associated with TM9SF1. Unc-51-like Kinase 2 (*C. elegans*) (ULK2, Accession NM_014683) is another VGAM49 host target gene. ULK2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ULK2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ULK2 BINDING SITE, designated SEQ ID:1523, to the nucleotide sequence of VGAM49 RNA, herein designated VGAM RNA, also designated SEQ ID:384.

[1299] Another function of VGAM49 is therefore inhibition of Unc-51-like Kinase 2 (*C. elegans*) (ULK2, Accession NM_014683). Accordingly, utilities of VGAM49 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ULK2. Unc-5 Homolog D (*C. elegans*) (UNC5D, Accession NM_080872) is another VGAM49 host target gene. UNC5D BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by UNC5D, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of UNC5D BINDING

SITE, designated SEQ ID:2393, to the nucleotide sequence of VGAM49 RNA, herein designated VGAM RNA, also designated SEQ ID:384.

[1300] Another function of VGAM49 is therefore inhibition of Unc-5 Homolog D (*C. elegans*) (UNC5D, Accession NM_080872). Accordingly, utilities of VGAM49 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UNC5D. LOC121219 (Accession XM_058544) is another VGAM49 host target gene. LOC121219 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC121219, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC121219 BINDING SITE, designated SEQ ID:2988, to the nucleotide sequence of VGAM49 RNA, herein designated VGAM RNA, also designated SEQ ID:384.

[1301] Another function of VGAM49 is therefore inhibition of LOC121219 (Accession XM_058544). Accordingly, utilities of VGAM49 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC121219. LOC128077 (Accession XM_059208) is an-

other VGAM49 host target gene. LOC128077 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC128077, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC128077 BINDING SITE, designated SEQ ID:3006, to the nucleotide sequence of VGAM49 RNA, herein designated VGAM RNA, also designated SEQ ID:384.

[1302] Another function of VGAM49 is therefore inhibition of LOC128077 (Accession XM_059208). Accordingly, utilities of VGAM49 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC128077. LOC143451 (Accession XM_084521) is another VGAM49 host target gene. LOC143451 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC143451, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC143451 BINDING SITE, designated SEQ ID:3058, to the nucleotide sequence of VGAM49 RNA, herein designated VGAM RNA, also designated SEQ ID:384.

[1303] Another function of VGAM49 is therefore inhibition of LOC143451 (Accession XM_084521). Accordingly, utilities of VGAM49 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC143451. LOC145125 (Accession XM_085025) is another VGAM49 host target gene. LOC145125 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC145125, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145125 BINDING SITE, designated SEQ ID:3075, to the nucleotide sequence of VGAM49 RNA, herein designated VGAM RNA, also designated SEQ ID:384.

[1304] Another function of VGAM49 is therefore inhibition of LOC145125 (Accession XM_085025). Accordingly, utilities of VGAM49 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145125. LOC149351 (Accession XM_086503) is another VGAM49 host target gene. LOC149351 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC149351, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149351 BINDING SITE, designated SEQ ID:3131, to the nucleotide sequence of VGAM49 RNA, herein designated VGAM RNA, also designated SEQ ID:384.

[1305] Another function of VGAM49 is therefore inhibition of LOC149351 (Accession XM_086503). Accordingly, utilities of VGAM49 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149351. LOC149722 (Accession XM_097709) is another VGAM49 host target gene. LOC149722 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC149722, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149722 BINDING SITE, designated SEQ ID:3312, to the nucleotide sequence of VGAM49 RNA, herein designated VGAM RNA, also designated SEQ ID:384.

[1306] Another function of VGAM49 is therefore inhibition of LOC149722 (Accession XM_097709). Accordingly, utilities of VGAM49 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC149722. LOC149837 (Accession XM_097747) is another VGAM49 host target gene. LOC149837 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC149837, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149837 BINDING SITE, designated SEQ ID:3318, to the nucleotide sequence of VGAM49 RNA, herein designated VGAM RNA, also designated SEQ ID:384.

[1307] Another function of VGAM49 is therefore inhibition of LOC149837 (Accession XM_097747). Accordingly, utilities of VGAM49 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149837. LOC150054 (Accession XM_097797) is another VGAM49 host target gene. LOC150054 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC150054, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150054 BINDING SITE, designated SEQ ID:3323, to the nucleotide sequence of VGAM49 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:384.

[1308] Another function of VGAM49 is therefore inhibition of LOC150054 (Accession XM_097797). Accordingly, utilities of VGAM49 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150054. LOC150150 (Accession XM_097820) is another VGAM49 host target gene. LOC150150 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC150150, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150150 BINDING SITE, designated SEQ ID:3324, to the nucleotide sequence of VGAM49 RNA, herein designated VGAM RNA, also designated SEQ ID:384.

[1309] Another function of VGAM49 is therefore inhibition of LOC150150 (Accession XM_097820). Accordingly, utilities of VGAM49 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150150. LOC150225 (Accession XM_097870) is another VGAM49 host target gene. LOC150225 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC150225, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150225 BINDING SITE, designated SEQ ID:3327, to the nucleotide sequence of VGAM49 RNA, herein designated VGAM RNA, also designated SEQ ID:384.

[1310] Another function of VGAM49 is therefore inhibition of LOC150225 (Accession XM_097870). Accordingly, utilities of VGAM49 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150225. LOC152816 (Accession XM_098270) is another VGAM49 host target gene. LOC152816 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC152816, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152816 BINDING SITE, designated SEQ ID:3364, to the nucleotide sequence of VGAM49 RNA, herein designated VGAM RNA, also designated SEQ ID:384.

[1311] Another function of VGAM49 is therefore inhibition of LOC152816 (Accession XM_098270). Accordingly, utilities of VGAM49 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LOC152816. LOC155038 (Accession XM_088130) is another VGAM49 host target gene. LOC155038 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC155038, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC155038 BINDING SITE, designated SEQ ID:3198, to the nucleotide sequence of VGAM49 RNA, herein designated VGAM RNA, also designated SEQ ID:384.

[1312] Another function of VGAM49 is therefore inhibition of LOC155038 (Accession XM_088130). Accordingly, utilities of VGAM49 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC155038. LOC158629 (Accession XM_098972) is another VGAM49 host target gene. LOC158629 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC158629, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158629 BINDING SITE, designated SEQ ID:3394, to

the nucleotide sequence of VGAM49 RNA, herein designated VGAM RNA, also designated SEQ ID:384.

[1313] Another function of VGAM49 is therefore inhibition of LOC158629 (Accession XM_098972). Accordingly, utilities of VGAM49 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158629. LOC158943 (Accession XM_018400) is another VGAM49 host target gene. LOC158943 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC158943, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158943 BINDING SITE, designated SEQ ID:2572, to the nucleotide sequence of VGAM49 RNA, herein designated VGAM RNA, also designated SEQ ID:384.

[1314] Another function of VGAM49 is therefore inhibition of LOC158943 (Accession XM_018400). Accordingly, utilities of VGAM49 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158943. LOC170082 (Accession XM_093092) is another VGAM49 host target gene. LOC170082 BINDING SITE is HOST TARGET binding site found in the 3' un-

translated region of mRNA encoded by LOC170082, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC170082 BINDING SITE, designated SEQ ID:3254, to the nucleotide sequence of VGAM49 RNA, herein designated VGAM RNA, also designated SEQ ID:384.

[1315] Another function of VGAM49 is therefore inhibition of LOC170082 (Accession XM_093092). Accordingly, utilities of VGAM49 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC170082. LOC199920 (Accession XM_114056) is another VGAM49 host target gene. LOC199920 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC199920, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC199920 BINDING SITE, designated SEQ ID:3436, to the nucleotide sequence of VGAM49 RNA, herein designated VGAM RNA, also designated SEQ ID:384.

[1316] Another function of VGAM49 is therefore inhibition of LOC199920 (Accession XM_114056). Accordingly, utilities

of VGAM49 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC199920. LOC219667 (Accession XM_166098) is another VGAM49 host target gene. LOC219667 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC219667, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219667 BINDING SITE, designated SEQ ID:3516, to the nucleotide sequence of VGAM49 RNA, herein designated VGAM RNA, also designated SEQ ID:384.

[1317] Another function of VGAM49 is therefore inhibition of LOC219667 (Accession XM_166098). Accordingly, utilities of VGAM49 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219667. LOC220279 (Accession XM_169083) is another VGAM49 host target gene. LOC220279 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC220279, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC220279 BINDING SITE, designated SEQ ID:3653, to the nucleotide sequence of VGAM49 RNA, herein designated VGAM RNA, also designated SEQ ID:384.

[1318] Another function of VGAM49 is therefore inhibition of LOC220279 (Accession XM_169083). Accordingly, utilities of VGAM49 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220279. LOC221830 (Accession XM_166508) is another VGAM49 host target gene. LOC221830 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221830, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221830 BINDING SITE, designated SEQ ID:3567, to the nucleotide sequence of VGAM49 RNA, herein designated VGAM RNA, also designated SEQ ID:384.

[1319] Another function of VGAM49 is therefore inhibition of LOC221830 (Accession XM_166508). Accordingly, utilities of VGAM49 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221830. LOC222166 (Accession XM_168425) is another VGAM49 host target gene. LOC222166 BINDING

SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC222166, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222166 BINDING SITE, designated SEQ ID:3635, to the nucleotide sequence of VGAM49 RNA, herein designated VGAM RNA, also designated SEQ ID:384.

[1320] Another function of VGAM49 is therefore inhibition of LOC222166 (Accession XM_168425). Accordingly, utilities of VGAM49 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222166. LOC254440 (Accession XM_173126) is another VGAM49 host target gene. LOC254440 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC254440, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254440 BINDING SITE, designated SEQ ID:3729, to the nucleotide sequence of VGAM49 RNA, herein designated VGAM RNA, also designated SEQ ID:384.

[1321] Another function of VGAM49 is therefore inhibition of

LOC254440 (Accession XM_173126). Accordingly, utilities of VGAM49 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254440. LOC51123 (Accession XM_018277) is another VGAM49 host target gene. LOC51123 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC51123, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51123 BINDING SITE, designated SEQ ID:2571, to the nucleotide sequence of VGAM49 RNA, herein designated VGAM RNA, also designated SEQ ID:384.

[1322] Another function of VGAM49 is therefore inhibition of LOC51123 (Accession XM_018277). Accordingly, utilities of VGAM49 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51123. LOC51596 (Accession NM_015921) is another VGAM49 host target gene. LOC51596 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC51596, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of LOC51596 BINDING SITE, designated SEQ ID:1651, to the nucleotide sequence of VGAM49 RNA, herein designated VGAM RNA, also designated SEQ ID:384.

[1323] Another function of VGAM49 is therefore inhibition of LOC51596 (Accession NM_015921). Accordingly, utilities of VGAM49 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51596. LOC84570 (Accession NM_032518) is another VGAM49 host target gene. LOC84570 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC84570, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC84570 BINDING SITE, designated SEQ ID:2257, to the nucleotide sequence of VGAM49 RNA, herein designated VGAM RNA, also designated SEQ ID:384.

[1324] Another function of VGAM49 is therefore inhibition of LOC84570 (Accession NM_032518). Accordingly, utilities of VGAM49 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC84570. LOC92710 (Accession XM_046811) is another

VGAM49 host target gene. LOC92710 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC92710, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92710 BINDING SITE, designated SEQ ID:2885, to the nucleotide sequence of VGAM49 RNA, herein designated VGAM RNA, also designated SEQ ID:384.

[1325] Another function of VGAM49 is therefore inhibition of LOC92710 (Accession XM_046811). Accordingly, utilities of VGAM49 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92710. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 50 (VGAM50) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[1326] VGAM50 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM50 was detected is described

hereinabove with reference to Figs. 1–8.

[1327] VGAM50 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus. VGAM50 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[1328] VGAM50 gene encodes a VGAM50 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM50 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM50 precursor RNA is designated SEQ ID:36, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:36 is located at position 2870 relative to the genome of Vaccinia Virus.

[1329] VGAM50 precursor RNA folds onto itself, forming VGAM50 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed–reversed sequence of the nucleotide

sequence of the second half thereof.

[1330] An enzyme complex designated DICER COMPLEX, `dices` the VGAM50 folded precursor RNA into VGAM50 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of VGAM50 RNA is designated SEQ ID:385, and is provided hereinbelow with reference to the sequence listing part.

[1331] VGAM50 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM50 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM50 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[1332] VGAM50 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM50 host target RNA,

herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM50 RNA is an accurate or a partial inverted-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM50 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM50 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[1333] The complementary binding of VGAM50 RNA, herein designated VGAM RNA, to host target binding sites on VGAM50 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM50 host tar-

get RNA into VGAM50 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[1334] It is appreciated that VGAM50 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM50 host target genes. The mRNA of each one of this plurality of VGAM50 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM50 RNA, herein designated VGAM RNA, and which when bound by VGAM50 RNA causes inhibition of translation of respective one or more VGAM50 host target proteins.

[1335] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM50 gene, herein designated VGAM GENE, on one or more VGAM50 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and

Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[1336] It is yet further appreciated that a function of VGAM50 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM50 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM50 correlate with, and may be deduced from, the identity of the host target genes which VGAM50 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[1337] Nucleotide sequences of the VGAM50 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM50 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM50 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM50 are further described hereinbelow with reference to Table 1.

[1338] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM50 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM50 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[1339] As mentioned hereinabove with reference to Fig. 1, a function of VGAM50 gene, herein designated VGAM is inhibition of expression of VGAM50 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM50 correlate with, and may be deduced from, the identity of the target genes which VGAM50 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[1340] Fanconi Anemia, Complementation Group F (FANCF, Accession NM_022725) is a VGAM50 host target gene. FANCF BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FANCF, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FANCF BINDING SITE, designated SEQ ID:1997,

to the nucleotide sequence of VGAM50 RNA, herein designated VGAM RNA, also designated SEQ ID:385.

[1341] A function of VGAM50 is therefore inhibition of Fanconi Anemia, Complementation Group F (FANCF, Accession NM_022725). Accordingly, utilities of VGAM50 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FANCF. G Protein-coupled Receptor 65 (GPR65, Accession XM_007392) is another VGAM50 host target gene. GPR65 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by GPR65, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GPR65 BINDING SITE, designated SEQ ID:2544, to the nucleotide sequence of VGAM50 RNA, herein designated VGAM RNA, also designated SEQ ID:385.

[1342] Another function of VGAM50 is therefore inhibition of G Protein-coupled Receptor 65 (GPR65, Accession XM_007392). Accordingly, utilities of VGAM50 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GPR65. Lamin B1 (LMNB1, Accession NM_005573) is another VGAM50 host target gene.

LMNB1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LMNB1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LMNB1 BINDING SITE, designated SEQ ID:1226, to the nucleotide sequence of VGAM50 RNA, herein designated VGAM RNA, also designated SEQ ID:385.

[1343] Another function of VGAM50 is therefore inhibition of Lamin B1 (LMNB1, Accession NM_005573), a gene which is thought to provide a framework for the nuclear envelope and may also interact with chromatin. Accordingly, utilities of VGAM50 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LMNB1. The function of LMNB1 has been established by previous studies. Lamins are the major components of the nuclear lamina which underlies the nuclear envelope of eukaryotic cells (see OMIM Ref. No. lamin A, 150330). Maeno et al. (1995) noted that lamins are members of the intermediate filament protein family. Vertebrate lamins are classified into 2 types, A and B, and mammalian somatic cells show 2 species of each type: lamins A and C

for the A type and B1 and B2 for the B type. In addition, germ-cell-specific lamins have been reported for both types (Furukawa and Hotta, 1993 and Furukawa et al., 1994). While A-type lamins are expressed in a developmentally controlled manner, B-type lamins are expressed in all kinds of cells. Although the role of lamins may be primarily structural, information about other functions such as interactions with interphase chromatin and involvement in DNA replication is accumulating. The lamin B gene in the mouse is located on chromosome 18 (Justice et al., 1992) in a region of linkage homology to the long arm of human chromosome 5. This gene (Lmnb1) was isolated by Maeno et al. (1995). Structural analysis showed that the lamin B1 gene spans about 43 kb of the genome and consists of 11 exons and 10 introns. Exon/intron structure of the B1 gene clearly showed the conserved organization among the intermediate filament protein family genes. The presumptive promoter region has high GC content and contains a CAAT box and multiple Sp1 sites but no classical TATA box, suggesting to the authors that the lamin B1 gene has a typical housekeeping gene promoter with a CpG island.

[1344] Full details of the abovementioned studies are described

in the following publications, the disclosure of which are hereby incorporated by reference:

- [1346] Maeno, H.; Sugimoto, K.; Nakajima, N. : Genomic structure of the mouse gene (Lmnb1) encoding nuclear lamin B1. Genomics 30: 342–346, 1995.
- [1347] Further studies establishing the function and utilities of LMNB1 are found in John Hopkins OMIM database record ID 150340, and in cited publications numbered 3012–3013, 2790, 3006–300 and 3011 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Multiple Endocrine Neoplasia I (MEN1, Accession XM_167804) is another VGAM50 host target gene. MEN1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MEN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MEN1 BINDING SITE, designated SEQ ID:3600, to the nucleotide sequence of VGAM50 RNA, herein designated VGAM RNA, also designated SEQ

ID:385.

[1348] Another function of VGAM50 is therefore inhibition of Multiple Endocrine Neoplasia I (MEN1, Accession XM_167804). Accordingly, utilities of VGAM50 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MEN1. Pleiomorphic Adenoma Gene 1 (PLAG1, Accession NM_002655) is another VGAM50 host target gene. PLAG1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PLAG1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PLAG1 BINDING SITE, designated SEQ ID:944, to the nucleotide sequence of VGAM50 RNA, herein designated VGAM RNA, also designated SEQ ID:385.

[1349] Another function of VGAM50 is therefore inhibition of Pleiomorphic Adenoma Gene 1 (PLAG1, Accession NM_002655), a gene which contains a zinc finger domain. Accordingly, utilities of VGAM50 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PLAG1. The function of PLAG1 has been established by previous studies. Pleomorphic adenomas

are benign epithelial tumors originating from the major and minor salivary glands (see OMIM Ref. No. 181030). They are characterized by recurrent chromosome translocations; the most common abnormalities involve chromosome 8, with consistent breakpoints at band q12. Kas et al. (1997) described the construction of 2 nonoverlapping YAC contigs covering about 75% of human chromosome band 8q12, which spans approximately 9 Mb of genomic DNA and includes a number of known genes such as MOS (OMIM Ref. No. 190060) and LYN (OMIM Ref. No. 165120), as well as novel genes and expressed sequence tags (ESTs). By fluorescence in situ hybridization, the authors determined that the majority of pleomorphic adenoma 8q12 breakpoints clustered within a 2-Mb contig that was mapped to the centromeric region of 8q12 and that was covered by 34 overlapping YAC clones, and tagged by 31 markers with an average spacing of 65 kb. Nine of 11 primary adenomas with 8q12 abnormalities had breakpoints mapping within a 300-kb interval. By searching sequence databases with sequence tagged sites (STSs) located within the 300-kb region, Kas et al. (1997) identified an EST with sequence identity to one of the STSs. Northern blot analysis using this EST detected a 7.5-kb transcript

representing pleomorphic adenoma gene-1 (PLAG1). The authors cloned human fetal kidney PLAG1 cDNAs and found that the PLAG1 gene contains 5 exons. Southern blot analysis of DNA from pleomorphic adenomas with t(3;8) detected rearrangements in the 5-prime noncoding region of the PLAG1 gene. Using 5-prime RACE or RT-PCR, the authors generated hybrid transcripts consisting of PLAG1 and beta-1-catenin (CTNNB1; 116806) from every primary tumor analyzed. Northern blot analysis of 3 pleomorphic adenomas with t(3;8) and 1 adenoma with a variant t(8;15) revealed that PLAG1 expression was activated by the translocations in all 4 tumors. Kas et al. (1997) detected the 7.5-kb PLAG1 transcript in normal human fetal lung, fetal liver, and fetal kidney, but not in the corresponding adult tissues, adult salivary gland, or fetal brain; CTNNB1 appeared to be ubiquitously expressed. The deduced PLAG1 protein has 2 potential nuclear localization signals in the N-terminal region, 7 zinc finger domains, and a serine-rich C terminus. Astrom et al. (1999) found overexpression of PLAG1 in 23 of 47 primary benign and malignant pleomorphic adenomas of the salivary glands. In 5 adenomas with a normal karyotype, fusion transcripts were found in 3; PLAG1 and CTNNB1

were fused in 1 case, and in 2 others PLAG1 was fused with the gene encoding transcription elongation factor SII (OMIM Ref. No. 601425). The fusions occurred in the 5-prime noncoding region of PLAG1, leading to exchange of regulatory control elements and, as a consequence, activation of PLAG1 gene expression. Because all of the cases had grossly normal karyotypes, the rearrangements must result from cryptic rearrangements.

[1350] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[1351] Astrom, A.-K.; Voz, M. L.; Kas, K.; Roijer, E.; Wedell, B.; Mandahl, N.; Van de Ven, W.; Mark, J.; Stenman, G. : Conserved mechanism of PLAG1 activation in salivary gland tumors with and without chromosome 8q12 abnormalities: identification of SII as a new fusion partner gene. Cancer Res. 59: 918-923, 1999. ; and

[1352] Kas, K.; Roijer, E.; Voz, M.; Meyen, E.; Stenman, G.; Van de Ven, W. J. M. : A 2-Mb YAC contig and physical map covering the chromosome 8q12 breakpoint cluster region in pleomorphic ad.

[1353] Further studies establishing the function and utilities of PLAG1 are found in John Hopkins OMIM database record

ID 603026, and in cited publications numbered 124 and 1338–1339 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. S100 Calcium Binding Protein A11 (calgizzarin) (S100A11, Accession NM_005620) is another VGAM50 host target gene. S100A11 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by S100A11, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of S100A11 BINDING SITE, designated SEQ ID:1231, to the nucleotide sequence of VGAM50 RNA, herein designated VGAM RNA, also designated SEQ ID:385.

[1354] Another function of VGAM50 is therefore inhibition of S100 Calcium Binding Protein A11 (calgizzarin) (S100A11, Accession NM_005620), a gene which is a tissue/cell type specific calcium-binding protein that interacts with target proteins to link extracellular stimuli to cellular responses; member of the S100 family. Accordingly, utilities of VGAM50 include diagnosis, prevention and treatment of diseases and clinical conditions associated with S100A11. The function of S100A11 has been established by previ-

ous studies. Proteins of the S100 protein family belong to the large group of EF-hand calcium-binding proteins. Todoroki et al. (1991) purified an S100 protein from chicken gizzard that they called calgizzarin. Watanabe et al. (1991) isolated a cDNA encoding rabbit calgizzarin. Tanaka et al. (1995) identified and sequenced a cDNA encoding a human calgizzarin homolog. They found that the expression of human calgizzarin was remarkably elevated in colorectal cancers compared with that in normal colorectal mucosa. Tomasetto et al. (1995) reported that calgizzarin, or MLN70, is one of several genes expressed in breast cancer-derived metastatic axillary lymph nodes but not in normal lymph nodes or breast fibroadenomas. By in situ hybridization, Moog-Lutz et al. (1995) mapped the calgizzarin, or S100C, gene to 1q21. By analysis of clones from this region, Wicki et al. (1996) determined that S100A11 is part of the S100 gene cluster and is located near S100A10 (OMIM Ref. No. 114085).

[1355] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[1356] Watanabe, M.; Ando, Y.; Todoroki, H.; Minami, H.; Hidaka, H. : Molecular cloning and sequencing of a cDNA clone

encoding a new calcium binding protein, named calgizarin, from rabbit lung. Biochem. Biophys. Res. Commun. 181: 644–649, 1991. ; and

[1357] Wicki, R.; Marenholz, I.; Mischke, D.; Schafer, B. W.; Heizmann, C. W. : Characterization of the human S100A12 (calgranulin C, p6, CAAF1, CGRP) gene, a new member of the S100 gene clust.

[1358] Further studies establishing the function and utilities of S100A11 are found in John Hopkins OMIM database record ID 603114, and in cited publications numbered 299–301, 135 and 1938 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Solute Carrier Family 9 (sodium/hydrogen exchanger), Isoform 6 (SLC9A6, Accession NM_006359) is another VGAM50 host target gene. SLC9A6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC9A6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC9A6 BINDING SITE, designated SEQ ID:1290, to the nucleotide sequence of VGAM50 RNA, herein designated VGAM RNA, also designated SEQ ID:385.

[1359] Another function of VGAM50 is therefore inhibition of Solute Carrier Family 9 (sodium/hydrogen exchanger), Isoform 6 (SLC9A6, Accession NM_006359), a gene which is involved electroneutral exchange of protons for Na^+ and K^+ across the mitochondrial inner membrane. Accordingly, utilities of VGAM50 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC9A6. The function of SLC9A6 has been established by previous studies. By searching sequence databases for proteins with sequence similarity to the *S. cerevisiae* mitochondrial sodium/hydrogen exchanger Nha2, Numata et al. (1998) identified the deduced protein product of the KIAA0267 cDNA (Nagase et al., 1996), SLC9A6. The KIAA0267-encoded protein shares 30% amino acid sequence identity with *S. cerevisiae* Nha2, and approximately 20 to 24% identity with the mammalian NHE isoforms NHE1 to NHE5 (see OMIM Ref. No. SLC9A5; 600477). Numata et al. (1998), who concluded that the KIAA0267 cDNA lacks 5-prime coding sequence, isolated a human cDNA containing the complete coding sequence of SLC9A6, which they called NHE6. The deduced 669-amino acid SLC9A6 protein has 12 putative membrane-spanning segments within the N-terminal region,

and a hydrophilic C terminus, similar to the topologies predicted for other NHEs. In addition, SLC9A6 has a putative mitochondrial inner membrane targeting signal at its N terminus. Northern blot analysis detected an approximately 5.5-kb SLC9A6 transcript that was ubiquitously expressed, with the most abundant expression in mitochondrion-rich tissues such as brain, skeletal muscle, and heart. Fluorescence microscopy suggested that SLC9A6 localizes to mitochondria. Numata et al. (1998) deleted the *S. cerevisiae* NHA2 gene by homologous disruption and found that benzamil-inhibitable, acid-activated sodium uptake into mitochondria was abolished in the mutant strain. The mutant strain also showed retarded growth on nonfermentable carbon sources and severely reduced survival during the stationary phase of the cell cycle compared with the parental strain, consistent with a defect in aerobic metabolism. The authors suggested that Nha2 and SLC9A6 are homologous sodium/hydrogen exchangers that are important for mitochondrial function.

[1360] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[1363] Further studies establishing the function and utilities of SLC9A6 are found in John Hopkins OMIM database record ID 300231, and in cited publications numbered 2015–2016 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Superoxide Dismutase 2, Mitochondrial (SOD2, Accession NM_000636) is another VGAM50 host target gene. SOD2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SOD2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SOD2 BINDING SITE, designated SEQ ID:766, to

the nucleotide sequence of VGAM50 RNA, herein designated VGAM RNA, also designated SEQ ID:385.

[1364] Another function of VGAM50 is therefore inhibition of Superoxide Dismutase 2, Mitochondrial (SOD2, Accession NM_000636), a gene which is intramitochondrial free radical scavenging enzyme. When he has polymorphism in signal peptides he could cause diseases of distribution. Accordingly, utilities of VGAM50 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SOD2. The function of SOD2 has been established by previous studies. Rosenblum et al. (1996) emphasized the importance of polymorphism in signal peptides that target organelle-specific proteins to their subcellular sites of action. They discovered a polymorphism when they cloned the SOD2 gene from cell lines of normal individuals and patients with genetic diseases of premature aging. The polymorphism consisted of a single nucleotide change in the region of the DNA that encodes the signal sequence such that either an alanine or a valine was present (147460.0001). Rosenblum et al. (1996) suggested that such signal sequence polymorphism could result in diseases of distribution, where essential proteins are not properly targeted, thereby leading to absolute or

relative deficiencies of critical enzymes within specific cellular compartments. They suggested that progeria (OMIM Ref. No. 176670) and related syndromes may be diseases of distribution. Hiroi et al. (1999) found an increased frequency for the SOD2-VV genotype (homozygosity for the valine (V) allele vs the alanine allele) in Japanese with non-familial idiopathic cardiomyopathy (IDC) and suggested that this polymorphism may collaborate with the DRP1*1401 allele of the HLA-DRB1 gene (OMIM Ref. No. 142857) in controlling the susceptibility to nonfamilial IDC

[1365] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[1366] Hiroi, S.; Harada, H.; Nishi, H.; Satoh, M.; Nagai, R.; Kimura, A. : Polymorphisms in the SOD2 and HLA-DRB1 genes are associated with nonfamilial idiopathic dilated cardiomyopathy in Japanese. Biochem. Biophys. Res. Commun. 261: 332-339, 1999. ; and

[1367] Rosenblum, J. S.; Gilula, N. B.; Lerner, R. A. : On signal sequence polymorphisms and diseases of distribution. Proc. Nat. Acad. Sci. 93: 4471-4473, 1996.

[1368] Further studies establishing the function and utilities of

SOD2 are found in John Hopkins OMIM database record ID 147460, and in cited publications numbered 798–802, 866–80 and 867–809 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Baculoviral IAP Repeat-containing 2 (BIRC2, Accession XM_040717) is another VGAM50 host target gene. BIRC2 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by BIRC2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BIRC2 BINDING SITE, designated SEQ ID:2784, to the nucleotide sequence of VGAM50 RNA, herein designated VGAM RNA, also designated SEQ ID:385.

[1369] Another function of VGAM50 is therefore inhibition of Baculoviral IAP Repeat-containing 2 (BIRC2, Accession XM_040717). Accordingly, utilities of VGAM50 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BIRC2. Chromosome X Open Reading Frame 1 (CXorf1, Accession NM_004709) is another VGAM50 host target gene. CXorf1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by CXorf1, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CXorf1 BINDING SITE, designated SEQ ID:1145, to the nucleotide sequence of VGAM50 RNA, herein designated VGAM RNA, also designated SEQ ID:385.

[1370] Another function of VGAM50 is therefore inhibition of Chromosome X Open Reading Frame 1 (CXorf1, Accession NM_004709). Accordingly, utilities of VGAM50 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CXorf1. KIAA0367 (Accession XM_041018) is another VGAM50 host target gene. KIAA0367 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0367, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0367 BINDING SITE, designated SEQ ID:2787, to the nucleotide sequence of VGAM50 RNA, herein designated VGAM RNA, also designated SEQ ID:385.

[1371] Another function of VGAM50 is therefore inhibition of KIAA0367 (Accession XM_041018). Accordingly, utilities

of VGAM50 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0367. KIAA1321 (Accession XM_030856) is another VGAM50 host target gene. KIAA1321 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1321, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1321 BINDING SITE, designated SEQ ID:2627, to the nucleotide sequence of VGAM50 RNA, herein designated VGAM RNA, also designated SEQ ID:385.

[1372] Another function of VGAM50 is therefore inhibition of KIAA1321 (Accession XM_030856). Accordingly, utilities of VGAM50 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1321. KIAA1718 (Accession XM_034823) is another VGAM50 host target gene. KIAA1718 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1718, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

KIAA1718 BINDING SITE, designated SEQ ID:2686, to the nucleotide sequence of VGAM50 RNA, herein designated VGAM RNA, also designated SEQ ID:385.

[1373] Another function of VGAM50 is therefore inhibition of KIAA1718 (Accession XM_034823). Accordingly, utilities of VGAM50 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1718. KIAA1789 (Accession XM_040486) is another VGAM50 host target gene. KIAA1789 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1789, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1789 BINDING SITE, designated SEQ ID:2781, to the nucleotide sequence of VGAM50 RNA, herein designated VGAM RNA, also designated SEQ ID:385.

[1374] Another function of VGAM50 is therefore inhibition of KIAA1789 (Accession XM_040486). Accordingly, utilities of VGAM50 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1789. PRO2964 (Accession NM_018547) is another VGAM50 host target gene. PRO2964 BINDING SITE is HOST

TARGET binding site found in the 3` untranslated region of mRNA encoded by PRO2964, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO2964 BINDING SITE, designated SEQ ID:1842, to the nucleotide sequence of VGAM50 RNA, herein designated VGAM RNA, also designated SEQ ID:385.

[1375] Another function of VGAM50 is therefore inhibition of PRO2964 (Accession NM_018547). Accordingly, utilities of VGAM50 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO2964. Solute Carrier Family 17 (sodium-dependent inorganic phosphate cotransporter), Member 6 (SLC17A6, Accession NM_020346) is another VGAM50 host target gene. SLC17A6 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SLC17A6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC17A6 BINDING SITE, designated SEQ ID:1912, to the nucleotide sequence of VGAM50 RNA, herein designated VGAM RNA, also designated SEQ

ID:385.

[1376] Another function of VGAM50 is therefore inhibition of Solute Carrier Family 17 (sodium-dependent inorganic phosphate cotransporter), Member 6 (SLC17A6, Accession NM_020346). Accordingly, utilities of VGAM50 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC17A6. TNF Receptor-associated Factor 3 (TRAF3, Accession XM_007256) is another VGAM50 host target gene. TRAF3 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by TRAF3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRAF3 BINDING SITE, designated SEQ ID:2542, to the nucleotide sequence of VGAM50 RNA, herein designated VGAM RNA, also designated SEQ ID:385.

[1377] Another function of VGAM50 is therefore inhibition of TNF Receptor-associated Factor 3 (TRAF3, Accession XM_007256). Accordingly, utilities of VGAM50 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRAF3. LOC151361 (Accession XM_098048) is another VGAM50 host target gene.

LOC151361 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC151361, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151361 BINDING SITE, designated SEQ ID:3344, to the nucleotide sequence of VGAM50 RNA, herein designated VGAM RNA, also designated SEQ ID:385.

[1378] Another function of VGAM50 is therefore inhibition of LOC151361 (Accession XM_098048). Accordingly, utilities of VGAM50 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151361. LOC158714 (Accession XM_088650) is another VGAM50 host target gene. LOC158714 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC158714, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158714 BINDING SITE, designated SEQ ID:3224, to the nucleotide sequence of VGAM50 RNA, herein designated VGAM RNA, also designated SEQ ID:385.

[1379] Another function of VGAM50 is therefore inhibition of LOC158714 (Accession XM_088650). Accordingly, utilities of VGAM50 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158714. LOC219667 (Accession XM_166098) is another VGAM50 host target gene. LOC219667 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC219667, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219667 BINDING SITE, designated SEQ ID:3518, to the nucleotide sequence of VGAM50 RNA, herein designated VGAM RNA, also designated SEQ ID:385.

[1380] Another function of VGAM50 is therefore inhibition of LOC219667 (Accession XM_166098). Accordingly, utilities of VGAM50 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219667. LOC91565 (Accession XM_039231) is another VGAM50 host target gene. LOC91565 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC91565, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91565 BINDING SITE, designated SEQ ID:2749, to the nucleotide sequence of VGAM50 RNA, herein designated VGAM RNA, also designated SEQ ID:385.

[1381] Another function of VGAM50 is therefore inhibition of LOC91565 (Accession XM_039231). Accordingly, utilities of VGAM50 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91565. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 51 (VGAM51) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[1382] VGAM51 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM51 was detected is described hereinabove with reference to Figs. 1–8.

[1383] VGAM51 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus. VGAM51 host target gene, herein designated VGAM HOST TARGET

GENE, is a human gene contained in the human genome.

[1384] VGAM51 gene encodes a VGAM51 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM51 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM51 precursor RNA is designated SEQ ID:37, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:37 is located at position 6123 relative to the genome of Vaccinia Virus.

[1385] VGAM51 precursor RNA folds onto itself, forming VGAM51 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[1386] An enzyme complex designated DICER COMPLEX, `dices` the VGAM51 folded precursor RNA into VGAM51 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of VGAM51 RNA is designated SEQ ID:386, and is provided hereinbelow with reference to the sequence listing part.

[1387] VGAM51 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM51 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM51 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[1388] VGAM51 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM51 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM51 RNA is an accurate or a partial inverted-reversed sequence of the nucleotide sequence of

each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM51 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM51 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR and 5' UTR regions.

[1389] The complementary binding of VGAM51 RNA, herein designated VGAM RNA, to host target binding sites on VGAM51 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM51 host target RNA into VGAM51 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[1390] It is appreciated that VGAM51 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM51 host target genes. The mRNA of each one of this plurality of VGAM51 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM51 RNA, herein designated VGAM RNA, and which when bound by VGAM51 RNA causes inhibition of translation of respective one or more VGAM51 host target proteins.

[1391] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM51 gene, herein designated VGAM GENE, on one or more VGAM51 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA

genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[1392] It is yet further appreciated that a function of VGAM51 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM51 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM51 correlate with, and may be deduced from, the identity of the host target genes which VGAM51 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[1393] Nucleotide sequences of the VGAM51 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM51 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM51 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM51 are further described hereinbelow with reference to Table 1.

[1394] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM51 host target RNA, and schematic representation of the complementarity of each of these

host target binding sites to VGAM51 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[1395] As mentioned hereinabove with reference to Fig. 1, a function of VGAM51 gene, herein designated VGAM is inhibition of expression of VGAM51 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM51 correlate with, and may be deduced from, the identity of the target genes which VGAM51 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[1396] Chromosome 1 Open Reading Frame 1 (C1orf1, Accession NM_001213) is a VGAM51 host target gene. C1orf1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by C1orf1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C1orf1 BINDING SITE, designated SEQ ID:809, to the nucleotide sequence of VGAM51 RNA, herein designated VGAM RNA, also designated SEQ ID:386.

[1397] A function of VGAM51 is therefore inhibition of Chromosome 1 Open Reading Frame 1 (C1orf1, Accession

NM_001213). Accordingly, utilities of VGAM51 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C1orf1. Lecithin Retinol Acyltransferase (phosphatidylcholine--retinol O-acyltransferase) (LRAT, Accession XM_011181) is another VGAM51 host target gene. LRAT BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LRAT, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LRAT BINDING SITE, designated SEQ ID:2556, to the nucleotide sequence of VGAM51 RNA, herein designated VGAM RNA, also designated SEQ ID:386.

[1398] Another function of VGAM51 is therefore inhibition of Lecithin Retinol Acyltransferase (phosphatidylcholine--retinol O-acyltransferase) (LRAT, Accession XM_011181). Accordingly, utilities of VGAM51 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LRAT. V-myb Myeloblastosis Viral Oncogene Homolog (avian)-like 1 (MYBL1, Accession XM_034274) is another VGAM51 host target gene. MYBL1 BINDING SITE is HOST TARGET binding

site found in the 3' untranslated region of mRNA encoded by MYBL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MYBL1 BINDING SITE, designated SEQ ID:2679, to the nucleotide sequence of VGAM51 RNA, herein designated VGAM RNA, also designated SEQ ID:386.

[1399] Another function of VGAM51 is therefore inhibition of V-myb Myeloblastosis Viral Oncogene Homolog (avian)-like 1 (MYBL1, Accession XM_034274), a gene which could have a role in the proliferation and/or differentiation of neurogenic, spermatogenic and b-lymphoid cells. Accordingly, utilities of VGAM51 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MYBL1. The function of MYBL1 has been established by previous studies. Nomura et al. (1988) isolated and characterized cDNA clones for 2 human MYB-related genes, AMYB and BMYB (OMIM Ref. No. 601415). Using probes in Southern blot analysis of rodent-human hybrid DNAs, Barletta et al. (1991) localized the MYBL1 locus to 8cen-q22 and refined the localization to 8q22-q23 by in situ hybridization. Takahashi et al. (1995) found that

MYBL1 mRNA is expressed mainly in testis and peripheral blood leukocytes. AMYB could activate transcription from the promoter-containing MYB-binding sites in all cells examined. In addition to the 2 domains (a DNA-binding domain and a transcriptional activation domain), 2 negative regulatory domains were identified in the MYBL1 gene. These results indicated that the gene functions as a transcriptional activator and that the regulatory mechanism of gene activity is similar to that of the MYB (OMIM Ref. No. 189990) gene.

- [1400] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:
- [1401] Nomura, N.; Takahashi, M.; Matsui, M.; Ishii, S.; Date, T.; Sasamoto, S.; Ishizaki, R. : Isolation of human cDNA clones of MYB-related genes, A-MYB and B-MYB. *Nucleic Acids Res.* 16: 11075-11089, 1988. ; and
- [1402] Takahashi, T.; Nakagoshi, H.; Sarai, A.; Nomura, N.; Yamamoto, T.; Ishii, S. : Human A-myb gene encodes a transcriptional activator containing the negative regulatory domains. *FEBS Lett.*
- [1403] Further studies establishing the function and utilities of MYBL1 are found in John Hopkins OMIM database record

ID 159405, and in cited publications numbered 2527–2529 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. KIAA1028 (Accession XM_166324) is another VGAM51 host target gene. KIAA1028 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1028, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1028 BINDING SITE, designated SEQ ID:3547, to the nucleotide sequence of VGAM51 RNA, herein designated VGAM RNA, also designated SEQ ID:386.

[1404] Another function of VGAM51 is therefore inhibition of KIAA1028 (Accession XM_166324). Accordingly, utilities of VGAM51 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1028. MGC2488 (Accession NM_024039) is another VGAM51 host target gene. MGC2488 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC2488, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of MGC2488 BINDING SITE, designated SEQ ID:2045, to the nucleotide sequence of VGAM51 RNA, herein designated VGAM RNA, also designated SEQ ID:386.

[1405] Another function of VGAM51 is therefore inhibition of MGC2488 (Accession NM_024039). Accordingly, utilities of VGAM51 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC2488. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 52 (VGAM52) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[1406] VGAM52 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM52 was detected is described hereinabove with reference to Figs. 1–8.

[1407] VGAM52 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus. VGAM52 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[1408] VGAM52 gene encodes a VGAM52 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM52 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM52 precursor RNA is designated SEQ ID:38, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:38 is located at position 6573 relative to the genome of Vaccinia Virus.

[1409] VGAM52 precursor RNA folds onto itself, forming VGAM52 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[1410] An enzyme complex designated DICER COMPLEX, `dices` the VGAM52 folded precursor RNA into VGAM52 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM52 RNA is designated SEQ ID:387, and is provided hereinbelow with reference to the sequence listing part.

[1411] VGAM52 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM52 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM52 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[1412] VGAM52 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM52 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM52 RNA is an accurate or a partial inverted-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration,

Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM52 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM52 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[1413] The complementary binding of VGAM52 RNA, herein designated VGAM RNA, to host target binding sites on VGAM52 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM52 host target RNA into VGAM52 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[1414] It is appreciated that VGAM52 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM52 host target genes. The mRNA of each one of this plurality of VGAM52 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM52 RNA, herein designated VGAM RNA, and which when bound by VGAM52 RNA causes inhibition of translation of respective one or more VGAM52 host target proteins.

[1415] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM52 gene, herein designated VGAM GENE, on one or more VGAM52 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective:

Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[1416] It is yet further appreciated that a function of VGAM52 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM52 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM52 correlate with, and may be deduced from, the identity of the host target genes which VGAM52 binds and inhibits, and the function of these host target genes, as elaborated herein–below.

[1417] Nucleotide sequences of the VGAM52 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM52 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM52 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM52 are further described hereinbelow with reference to Table 1.

[1418] Nucleotide sequences of host target binding sites, such as BINDING SITE–I, BINDING SITE–II and BINDING SITE–III of Fig. 1, found on VGAM52 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM52 RNA, herein desig–

nated VGAM RNA, are described hereinbelow with reference to Table 2.

[1419] As mentioned hereinabove with reference to Fig. 1, a function of VGAM52 gene, herein designated VGAM is inhibition of expression of VGAM52 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM52 correlate with, and may be deduced from, the identity of the target genes which VGAM52 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[1420] Chemokine (C-X3-C motif) Receptor 1 (CX3CR1, Accession XM_047502) is a VGAM52 host target gene. CX3CR1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CX3CR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CX3CR1 BINDING SITE, designated SEQ ID:2891, to the nucleotide sequence of VGAM52 RNA, herein designated VGAM RNA, also designated SEQ ID:387.

[1421] A function of VGAM52 is therefore inhibition of Chemokine (C-X3-C motif) Receptor 1 (CX3CR1, Acces-

sion XM_047502), a gene which mediates both the adhesive and migratory functions of fractalkine. Accordingly, utilities of VGAM52 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CX3CR1. The function of CX3CR1 has been established by previous studies. Leukocyte trafficking at the endothelium requires both cellular adhesion molecules and chemotactic factors. Fractalkine (OMIM Ref. No. 601880), a transmembrane molecule with a CX3C-motif chemokine domain atop a mucin stalk, induces both adhesion and migration of leukocytes. Imai et al. (1997) identified a 7-transmembrane high-affinity receptor for fractalkine and showed that it mediates both the adhesive and migratory functions of fractalkine. The receptor, which the authors termed CX3CR1, requires pertussis toxin-sensitive G protein signaling to induce migration but not to support adhesion, which also occurs without other adhesion molecules but requires the architecture of a chemokine domain atop the mucin stalk. Natural killer cells predominantly express CX3CR1 and respond to fractalkine in both migration and adhesion. Imai et al. (1997) concluded that fractalkine and CX3CR1 represent new types of leukocyte trafficking regulators, performing

both adhesive and chemotactic functions. CX3CR1 is an HIV coreceptor as well as a leukocyte chemotactic/adhesion receptor for fractalkine. Faure et al. (2000) identified 2 single nucleotide polymorphisms in the CX3CR1 gene in Caucasians and demonstrated that HIV-infected patients homozygous for I249/M280 (601470.0001) progressed to AIDS more rapidly than those with other haplotypes (relative risk = 2.13, P = 0.039). Functional CX3CR1 analysis showed that fractalkine binding is reduced among patients homozygous for this particular haplotype. Thus, Faure et al. (2000) concluded that CX3CR1-I249/M280 is a recessive genetic risk factor for HIV/AIDS. Tripp et al. (2001) showed that the G glycoprotein of respiratory syncytial virus (RSV) shares a heparin-binding domain and a CX3C chemokine motif with CX3CL1. Binding analysis indicated that RSV can use CX3CR1 as a receptor. G glycoprotein binding mimics fractalkine binding and induces leukocyte chemotaxis. Tripp et al. (2001) concluded that RSV G glycoprotein uses its similarities with CX3C to facilitate infection and to modify the immune response.

[1422] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

M.; Debre, P.; Theodorou, I.; Combadiere, C. : Rapid progression to AIDS in HIV+ individuals with a structural variant of the chemokine receptor CX(3)CR1. *Science* 287: 2274–2277, 2000. ; and
- [1424] Moatti, D.; Faure, S.; Fumeron, F.; Amara, M. E. W.; Sek-nadji, P.; McDermott, D. H.; Debre, P.; Aumont, M. C.; Murphy, P. M.; de Prost, D.; Combadiere, C. : Polymorphism in the fractalk.
- [1425] Further studies establishing the function and utilities of CX3CR1 are found in John Hopkins OMIM database record ID 601470, and in cited publications numbered 1552–155 and 1851–1556 listed in the bibliography section herein–below, which are also hereby incorporated by reference. Wingless–type MMTV Integration Site Family, Member 14 (WNT14, Accession NM_003395) is another VGAM52 host target gene. WNT14 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by WNT14, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of WNT14 BINDING SITE, designated SEQ ID:1014, to the nucleotide sequence of VGAM52 RNA, herein designated VGAM RNA, also designated SEQ ID:387.

[1426] Another function of VGAM52 is therefore inhibition of Wingless-type MMTV Integration Site Family, Member 14 (WNT14, Accession NM_003395), a gene which is a ligand for members of the frizzled family of seven transmembrane receptors and may be a signaling molecule which affect the development of discrete regions of tissues. Accordingly, utilities of VGAM52 include diagnosis, prevention and treatment of diseases and clinical conditions associated with WNT14. The function of WNT14 has been established by previous studies. The WNT gene family consists of structurally related genes that encode cysteine-rich secreted glycoproteins that act as extracellular signaling factors. WNT genes are implicated in a wide variety of biologic processes including cell fate determination and patterning in early embryos and in cell growth and/or differentiation in certain adult mammalian tissues. Bergstein et al. (1997) stated that all WNT genes identified in mammals encode proteins of approximately 350 to 400 amino acids with an amino-terminal secretory signal pep-

tide followed by a short domain of low sequence conservation and then by a large conserved domain that includes 22 cysteine residues, the relative spacing of which is exactly conserved in the majority of known WNT proteins. By PCR with degenerate primers, Bergstein et al. (1997) isolated 2 novel members of the WNT family in humans, WNT14 and WNT15 (OMIM Ref. No. 602864). WNT14 shows 75% amino acid identity to chicken Wnt14 and 54% identity to human WNT15. Bergstein et al. (1997) reported that, based on both an unusual cysteine spacing pattern and amino acid sequence comparison, WNT14 and WNT15 are more closely related to *Drosophila* Wnt4 (OMIM Ref. No. 603490) and hagfish Wnt9 than to other members of the WNT family and may share common ancestry. During analysis of human genome draft sequence containing WNT3A (OMIM Ref. No. 606359), Saitoh et al. (2001) identified WNT14 gene fragments. Using RACE and cDNA-PCR, they assembled a WNT14 cDNA sequence. WNT14 encodes a deduced 365-amino acid protein containing an N-linked glycosylation site and residues conserved among members of the WNT family. Northern blot analysis detected a 4.4-kb WNT14 transcript at moderate levels in adult skeletal muscle and heart and at low levels in pla-

centa, adult lung, pancreas, spleen, ovary, fetal brain, and fetal lung. Using cDNA-PCR, Saitoh et al. (2001) detected WNT14 expression in gastric cancer cell lines. Hartmann and Tabin (2001) presented evidence that Wnt14 plays a central role in initiating synovial joint formation in the chick limb. Wnt14 was expressed in joint-forming regions prior to the segmentation of the cartilage elements, and local misexpression of Wnt14 induced morphologic and molecular changes characteristic of the first steps of joint formation. Induction of an ectopic joint-like region by Wnt14 suppressed the formation of the immediately adjacent endogenous joint, potentially providing insight into the spacing of joints. Saitoh et al. (2001) determined that the WNT14 gene contains 4 exons and spans about 27 kb of genomic DNA. WNT14 and WNT3A are clustered in a head-to-head manner with an interval of about 58 kb.

[1427] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[1428] Hartmann, C.; Tabin, C. J. : Wnt-14 plays a pivotal role in inducing synovial joint formation in the developing appendicular skeleton. Cell 104: 341-351, 2001. ; and

[1429] Saitoh, T.; Hirai, M.; Katoh, M. : Molecular cloning and

characterization of WNT3A and WNT14 clustered in human chromosome 1q42 region. Biochem. Biophys. Res. Commun. 284: 1168–1175, 20.

[1430] Further studies establishing the function and utilities of WNT14 are found in John Hopkins OMIM database record ID 602863, and in cited publications numbered 1210–1212 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. FLJ20275 (Accession NM_017737) is another VGAM52 host target gene. FLJ20275 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20275, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20275 BINDING SITE, designated SEQ ID:1745, to the nucleotide sequence of VGAM52 RNA, herein designated VGAM RNA, also designated SEQ ID:387.

[1431] Another function of VGAM52 is therefore inhibition of FLJ20275 (Accession NM_017737). Accordingly, utilities of VGAM52 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20275. FLJ22390 (Accession NM_022746) is another VGAM52

host target gene. FLJ22390 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ22390, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22390 BINDING SITE, designated SEQ ID:2002, to the nucleotide sequence of VGAM52 RNA, herein designated VGAM RNA, also designated SEQ ID:387.

[1432] Another function of VGAM52 is therefore inhibition of FLJ22390 (Accession NM_022746). Accordingly, utilities of VGAM52 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22390. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 53 (VGAM53) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[1433] VGAM53 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM53 was detected is described hereinabove with reference to Figs. 1–8.

[1434] VGAM53 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus. VGAM53 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[1435] VGAM53 gene encodes a VGAM53 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM53 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM53 precursor RNA is designated SEQ ID:39, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:39 is located at position 5257 relative to the genome of Vaccinia Virus.

[1436] VGAM53 precursor RNA folds onto itself, forming VGAM53 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[1437] An enzyme complex designated DICER COMPLEX, `dices` the VGAM53 folded precursor RNA into VGAM53 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of VGAM53 RNA is designated SEQ ID:388, and is provided hereinbelow with reference to the sequence listing part.

[1438] VGAM53 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM53 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM53 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[1439] VGAM53 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM53 host target RNA, herein designated VGAM HOST TARGET RNA. This com-

plementary binding is due to the fact that the nucleotide sequence of VGAM53 RNA is an accurate or a partial inverted-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM53 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM53 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[1440] The complementary binding of VGAM53 RNA, herein designated VGAM RNA, to host target binding sites on VGAM53 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM53 host target RNA into VGAM53 host target protein, herein desig-

nated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[1441] It is appreciated that VGAM53 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM53 host target genes. The mRNA of each one of this plurality of VGAM53 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM53 RNA, herein designated VGAM RNA, and which when bound by VGAM53 RNA causes inhibition of translation of respective one or more VGAM53 host target proteins.

[1442] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM53 gene, herein designated VGAM GENE, on one or more VGAM53 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also

believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[1443] It is yet further appreciated that a function of VGAM53 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM53 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM53 correlate with, and may be deduced from, the identity of the host target genes which VGAM53 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[1444] Nucleotide sequences of the VGAM53 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM53 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM53 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM53 are further described hereinbelow with reference to Table 1.

[1445] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM53 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM53 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[1446] As mentioned hereinabove with reference to Fig. 1, a function of VGAM53 gene, herein designated VGAM is inhibition of expression of VGAM53 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM53 correlate with, and may be deduced from, the identity of the target genes which VGAM53 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[1447] LOC120864 (Accession XM_058510) is a VGAM53 host target gene. LOC120864 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC120864, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC120864 BINDING SITE, designated SEQ ID:2986, to the nucleotide sequence of VGAM53 RNA, herein designated VGAM RNA, also desig-

nated SEQ ID:388.

[1448] A function of VGAM53 is therefore inhibition of LOC120864 (Accession XM_058510). Accordingly, utilities of VGAM53 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC120864. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 54 (VGAM54) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[1449] VGAM54 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM54 was detected is described hereinabove with reference to Figs. 1–8.

[1450] VGAM54 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus. VGAM54 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[1451] VGAM54 gene encodes a VGAM54 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM54

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM54 precursor RNA is designated SEQ ID:40, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:40 is located at position 4867 relative to the genome of Vaccinia Virus.

[1452] VGAM54 precursor RNA folds onto itself, forming VGAM54 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[1453] An enzyme complex designated DICER COMPLEX, `dices` the VGAM54 folded precursor RNA into VGAM54 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 82%) nucleotide sequence of VGAM54 RNA is designated SEQ ID:389, and is provided hereinbelow with reference to the sequence listing part.

[1454] VGAM54 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM54 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM54 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[1455] VGAM54 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM54 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM54 RNA is an accurate or a partial inverted-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host tar-

get binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM54 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM54 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[1456] The complementary binding of VGAM54 RNA, herein designated VGAM RNA, to host target binding sites on VGAM54 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM54 host target RNA into VGAM54 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[1457] It is appreciated that VGAM54 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM54 host target genes. The mRNA of each one of this plurality of VGAM54 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM54 RNA, herein designated VGAM RNA, and which when bound by VGAM54 RNA causes inhibition of translation of respective one or more VGAM54 host target proteins.

[1458] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM54 gene, herein designated VGAM GENE, on one or more VGAM54 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[1459] It is yet further appreciated that a function of VGAM54 is inhibition of expression of host target genes, as part of a

novel viral mechanism of attacking a host. Accordingly, utilities of VGAM54 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM54 correlate with, and may be deduced from, the identity of the host target genes which VGAM54 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[1460] Nucleotide sequences of the VGAM54 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM54 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM54 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM54 are further described hereinbelow with reference to Table 1.

[1461] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM54 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM54 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[1462] As mentioned hereinabove with reference to Fig. 1, a

function of VGAM54 gene, herein designated VGAM is inhibition of expression of VGAM54 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM54 correlate with, and may be deduced from, the identity of the target genes which VGAM54 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[1463] KIAA0626 (Accession NM_021647) is a VGAM54 host target gene. KIAA0626 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0626, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0626 BINDING SITE, designated SEQ ID:1954, to the nucleotide sequence of VGAM54 RNA, herein designated VGAM RNA, also designated SEQ ID:389.

[1464] A function of VGAM54 is therefore inhibition of KIAA0626 (Accession NM_021647). Accordingly, utilities of VGAM54 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0626.

KIAA1239 (Accession XM_049078) is another VGAM54 host target gene. KIAA1239 BINDING SITE is HOST TARGET

binding site found in the 3' untranslated region of mRNA encoded by KIAA1239, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1239 BINDING SITE, designated SEQ ID:2914, to the nucleotide sequence of VGAM54 RNA, herein designated VGAM RNA, also designated SEQ ID:389.

[1465] Another function of VGAM54 is therefore inhibition of KIAA1239 (Accession XM_049078). Accordingly, utilities of VGAM54 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1239. LOC201475 (Accession XM_113967) is another VGAM54 host target gene. LOC201475 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC201475, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC201475 BINDING SITE, designated SEQ ID:3428, to the nucleotide sequence of VGAM54 RNA, herein designated VGAM RNA, also designated SEQ ID:389.

[1466] Another function of VGAM54 is therefore inhibition of

LOC201475 (Accession XM_113967). Accordingly, utilities of VGAM54 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201475. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 55 (VGAM55) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[1467] VGAM55 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM55 was detected is described hereinabove with reference to Figs. 1–8.

[1468] VGAM55 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus. VGAM55 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[1469] VGAM55 gene encodes a VGAM55 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM55 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide se–

quence of VGAM55 precursor RNA is designated SEQ ID:41, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:41 is located at position 185510 relative to the genome of Vaccinia Virus.

[1470] VGAM55 precursor RNA folds onto itself, forming VGAM55 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[1471] An enzyme complex designated DICER COMPLEX, `dices` the VGAM55 folded precursor RNA into VGAM55 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of VGAM55 RNA is designated SEQ ID:390, and is

provided hereinbelow with reference to the sequence listing part.

[1472] VGAM55 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM55 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM55 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[1473] VGAM55 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM55 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM55 RNA is an accurate or a partial inverted-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM55 RNA,

herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM55 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR and 5' UTR regions.

[1474] The complementary binding of VGAM55 RNA, herein designated VGAM RNA, to host target binding sites on VGAM55 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM55 host target RNA into VGAM55 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[1475] It is appreciated that VGAM55 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM55 host target genes. The mRNA of each one of this plurality of VGAM55 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM55 RNA, herein designated VGAM

RNA, and which when bound by VGAM55 RNA causes inhibition of translation of respective one or more VGAM55 host target proteins.

[1476] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM55 gene, herein designated VGAM GENE, on one or more VGAM55 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[1477] It is yet further appreciated that a function of VGAM55 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM55 include diagnosis, prevention and

treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM55 correlate with, and may be deduced from, the identity of the host target genes which VGAM55 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[1478] Nucleotide sequences of the VGAM55 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM55 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM55 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM55 are further described hereinbelow with reference to Table 1.

[1479] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM55 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM55 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[1480] As mentioned hereinabove with reference to Fig. 1, a function of VGAM55 gene, herein designated VGAM is inhibition of expression of VGAM55 target genes. It is ap-

preciated that specific functions, and accordingly utilities, of VGAM55 correlate with, and may be deduced from, the identity of the target genes which VGAM55 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[1481] Archain 1 (ARCN1, Accession NM_001655) is a VGAM55 host target gene. ARCN1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ARCN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARCN1 BINDING SITE, designated SEQ ID:844, to the nucleotide sequence of VGAM55 RNA, herein designated VGAM RNA, also designated SEQ ID:390.

[1482] A function of VGAM55 is therefore inhibition of Archain 1 (ARCN1, Accession NM_001655), a gene which plays a fundamental role in eukaryotic cell biology. Accordingly, utilities of VGAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARCN1. The function of ARCN1 has been established by previous studies. Radice et al. (1995) identified a gene that maps approximately 50-kb telomeric to MLL (OMIM

Ref. No. 159555) in band 11q23.3, a locus disrupted in certain leukemia-associated translocation chromosomes. A 200-kb genomic fragment from a YAC that includes MLL was used to screen a cDNA library of the R54;11 cell line which carries a translocation chromosome t(4;11)(q21; q23). The cDNA sequence predicts a 511-amino acid protein which shares similarity with predicted proteins of unknown function from rice (*Oryza sativa*) and *Drosophila*. Because of this ancient conservation the authors proposed the name archain (ARCN1). Radice et al. (1995) detected 4-kb ARCN1 transcripts by Northern blot analysis in all tissues examined. The protein encoded by the ARCN1 gene, the coatomer protein delta-COP, probably plays a fundamental role in eukaryotic cell biology. Tunnacliffe et al. (1996) demonstrated that it is conserved across diverse eukaryotes. Very close or identical matches were seen in rat and cow; highly significant matches were seen with 2 plant species, *A. thaliana* (cress) and *S. tuberosum* (OMIM Ref. No. potato). Of particular biologic significance was the match with a sequence on yeast chromosome VI, from which Tunnacliffe et al. (1996) were able to determine the yeast archain gene and protein sequence. Unpublished data indicated that in situ hy-

bridizations on mouse embryo sections showed archain transcripts throughout the whole animal.

[1483] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[1484] Radice, P.; Pensotti, V.; Jones, C.; Perry, H.; Pierotti, M. A.; Tunnacliffe, A. : The human archain gene, ARCN1, has highly conserved homologs in rice and Drosophila. *Genomics* 26: 101–106, 1995. ; and

[1485] Tunnacliffe, A.; van de Vrugt, H.; Pensotti, V.; Radice, P. : The coatomer protein delta-COP, encoded by the archain gene, is conserved across diverse eukaryotes. *Mammalian Genome* 7: 78.

[1486] Further studies establishing the function and utilities of ARCN1 are found in John Hopkins OMIM database record ID 600820, and in cited publications numbered 1698–1699 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Cathepsin K (pseudosyndactylism) (CTSK, Accession NM_000396) is another VGAM55 host target gene. CTSK BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CTSK, corresponding to a HOST TARGET binding site such as BINDING

SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CTSK BINDING SITE, designated SEQ ID:736, to the nucleotide sequence of VGAM55 RNA, herein designated VGAM RNA, also designated SEQ ID:390.

[1487] Another function of VGAM55 is therefore inhibition of Cathepsin K (pseudodysostosis) (CTSK, Accession NM_000396). Accordingly, utilities of VGAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CTSK. High-mobility Group 20A (HMG20A, Accession NM_018200) is another VGAM55 host target gene. HMG20A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HMG20A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HMG20A BINDING SITE, designated SEQ ID:1800, to the nucleotide sequence of VGAM55 RNA, herein designated VGAM RNA, also designated SEQ ID:390.

[1488] Another function of VGAM55 is therefore inhibition of High-mobility Group 20A (HMG20A, Accession NM_018200). Accordingly, utilities of VGAM55 include di-

agnosis, prevention and treatment of diseases and clinical conditions associated with HMG20A. PR Domain Containing 2, with ZNF Domain (PRDM2, Accession NM_012231) is another VGAM55 host target gene. PRDM2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PRDM2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRDM2 BINDING SITE, designated SEQ ID:1415, to the nucleotide sequence of VGAM55 RNA, herein designated VGAM RNA, also designated SEQ ID:390.

[1489] Another function of VGAM55 is therefore inhibition of PR Domain Containing 2, with ZNF Domain (PRDM2, Accession NM_012231), a gene which plays a role in transcriptional regulation during neuronal differentiation and pathogenesis of retinoblastoma. Accordingly, utilities of VGAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRDM2. The function of PRDM2 has been established by previous studies. The retinoblastoma protein (OMIM Ref. No. 180200) is a target of viral oncoproteins. To explore the hypothesis that viral proteins may be structural mimics of

cellular RB-binding proteins that normally mediate RB function, Buyse et al. (1995) searched cDNA libraries for RB-binding proteins. They reported the cloning of a cDNA for the zinc finger protein they called RIZ from rat and human cells. It is a 250-kD nuclear protein containing 8 zinc finger motifs. It contains an RB-binding motif that is related to that of the adenovirus E1A oncoprotein; RIZ also shares an antigenic epitope with the C terminus of E1A. It is expressed in human retinoblastoma cells and at low levels in all other human cell lines examined. While the function of RIZ was not clear, its structure and pattern of expression suggested to Buyse et al. (1995) a role in transcriptional regulation during neuronal differentiation and pathogenesis of retinoblastoma. The distal portion of chromosome 1p is one of the most commonly affected regions in human cancer. In a study of hereditary and sporadic colorectal cancer, Chadwick et al. (2000) identified a region of frequent deletion at 32.2 centimorgans from 1ptel. Deletion breakpoints clustered in the vicinity of or inside the gene RIZ. Sequence analysis demonstrated frequent frameshift mutations of the RIZ gene. The mutations consisted of 1- or 2-bp deletions of coding poly(A) tracts (A)₈ or (A)₉, and were confined to microsatellite-unsta-

ble colorectal tumors, being present in 9 of 24 (37.5%) primary tumors and in 6 of 11 (54.5%) cell lines; in 2 cell lines the mutation was homozygous (or hemizygous). The mutations apparently were selected clonally in tumorigenesis, because similar poly(A) tracts in other genes were not affected. Of the 2 alternative products of the gene, RIZ1 contains a PR domain implicated in tumor suppressor function and RIZ2 lacks this motif. Chadwick et al. (2000) proposed that RIZ is a target of observed 1p alterations, with impairment of the PR domain-mediated function through either frameshift mutation or genomic deletion.

[1490] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[1491] Buyse, I. M.; Shao, G.; Huang, S. : The retinoblastoma protein binds to RIZ, a zinc-finger protein that shares an epitope with the adenovirus E1A protein. *Proc. Nat. Acad. Sci.* 92: 4467-4471, 1995. ; and

[1493] Further studies establishing the function and utilities of

PRDM2 are found in John Hopkins OMIM database record ID 601196, and in cited publications numbered 2227–2231 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. RNA (guanine–7–) Methyltransferase (RNMT, Accession NM_003799) is another VGAM55 host target gene. RNMT BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RNMT, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RNMT BINDING SITE, designated SEQ ID:1060, to the nucleotide sequence of VGAM55 RNA, herein designated VGAM RNA, also designated SEQ ID:390.

[1494] Another function of VGAM55 is therefore inhibition of RNA (guanine–7–) Methyltransferase (RNMT, Accession NM_003799), a gene which catalyzes the methylation of GpppN– at the guanine N7 position. Accordingly, utilities of VGAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RNMT. The function of RNMT has been established by previous studies. In mammals, 5–prime–terminal caps are formed on nascent pre–mRNAs by the sequential action of 2 en–

zymes, the bifunctional capping enzyme RNGTT (OMIM Ref. No. 603512) and RNA (guanine-7) methyltransferase. RNGTT catalyzes the removal of the gamma-phosphate of the initiating nucleotide and transfers GMP from GTP to the resulting diphosphate end. RNA (guanine-7) methyltransferase catalyzes the subsequent N7 methylation of the newly formed termini. The terminal 7-methylguanosine is recognized by cap-binding proteins that facilitate key events in gene expression. By searching an EST database for sequences homologous to that of *S. cerevisiae* RNA (guanine-7) methyltransferase, Pillutla et al. (1998) identified a human Met cDNA. The predicted 476-amino acid MET protein contains several conserved motifs known to be required for methyltransferase activity. Recombinant Met exhibited RNA (guanine-7) methyltransferase activity in vitro, and formed ternary complexes with RNGTT and the elongating form of RNA polymerase II. By screening human brain cDNAs for those encoding large proteins, Ishikawa et al. (1997) identified KIAA0398, an RNMT cDNA. Tsukamoto et al. (1998) isolated 3 human cDNAs encoding mRNA RNMT, which they termed HCMT1a, HCMT1b, and HCMT1c, which appear to be produced by alternative splicing. HCMT1a and HCMT1b en-

code deduced proteins of 476 and 504 amino acids, respectively, and differ only in the region encoding the C-terminal portion of the enzyme after residue 465. HCMT1c appears to encode the same polypeptide as HCMT1a; however, the 3-prime noncoding region of HCMT1c contains sequences corresponding to portions of both HCMT1a and HCMT1b. RT-PCR detected expression of the 3 mRNAs in all tissues tested. Recombinant HCMT1a expressed in *E. coli* exhibited mRNA RNMT activity, whereas recombinant HCMT1b did not. By analysis of a radiation hybrid panel, Pillutla et al. (1998) and Ishikawa et al. (1997) mapped the RNMT gene to chromosome 18. Pillutla et al. (1998) refined the location to 18p11.23–p11.22 using fluorescence in situ hybridization.

[1495] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[1496] Pillutla, R. C.; Yue, Z.; Maldonado, E.; Shatkin, A. J. : Recombinant human mRNA cap methyltransferase binds capping enzyme/RNA polymerase II complexes. *J. Biol. Chem.* 273: 21443–21446, 1998. ; and

[1497] Tsukamoto, T.; Shibagaki, Y.; Niikura, Y.; Mizumoto, K. :

Cloning and characterization of three human cDNAs encoding mRNA (guanine-7)-methyltransferase, an mRNA cap methylase. Biochem. B.

[1498] Further studies establishing the function and utilities of RNMT are found in John Hopkins OMIM database record ID 603514, and in cited publications numbered 25 and 258-259 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Src Family Associated Phosphoprotein 1 (SCAP1, Accession NM_003726) is another VGAM55 host target gene. SCAP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SCAP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SCAP1 BINDING SITE, designated SEQ ID:1052, to the nucleotide sequence of VGAM55 RNA, herein designated VGAM RNA, also designated SEQ ID:390.

[1499] Another function of VGAM55 is therefore inhibition of Src Family Associated Phosphoprotein 1 (SCAP1, Accession NM_003726). Accordingly, utilities of VGAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SCAP1. Usher Syndrome 3A

(USH3A, Accession NM_052995) is another VGAM55 host target gene. USH3A BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by USH3A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of USH3A BINDING SITE, designated SEQ ID:2355, to the nucleotide sequence of VGAM55 RNA, herein designated VGAM RNA, also designated SEQ ID:390.

[1500] Another function of VGAM55 is therefore inhibition of Usher Syndrome 3A (USH3A, Accession NM_052995). Accordingly, utilities of VGAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with USH3A. Vesicle Amine Transport Protein 1 Homolog (T californica) (VAT1, Accession NM_006373) is another VGAM55 host target gene. VAT1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by VAT1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of VAT1 BINDING SITE, designated SEQ ID:1292, to the nucleotide se-

quence of VGAM55 RNA, herein designated VGAM RNA, also designated SEQ ID:390.

[1501] Another function of VGAM55 is therefore inhibition of Vesicle Amine Transport Protein 1 Homolog (T californica) (VAT1, Accession NM_006373), a gene which is a membrane protein of cholinergic synaptic vesicles. Accordingly, utilities of VGAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with VAT1. The function of VAT1 has been established by previous studies. The physiologic and behavioral effects of pharmacologic agents that interfere with the transport of monoamine neurotransmitters into vesicles suggest that vesicular amine transport may contribute to human neuropsychiatric disease. Biogenic amines have been implicated in a wide range of clinical disorders and physiologic states such as consciousness, motivation, organizational thought, mood, and motor control, sensory perception, and autonomic phenomena such as heart rate, vascular tone, and blood pressure. Peter et al. (1993) isolated a human cDNA for the brain vesicular amine transporter. They found that the brain synaptic vesicle amine transporter (SVAT) showed conservation with the corresponding gene in the rat in the regions that diverge ex-

tensively between rat SVAT and the rat adrenal chromaffin granule amine transporter (CGAT). Using the cloned sequences with a panel of mouse/human hybrids and in situ hybridization, Peter et al. (1993) mapped the adrenal CGAT gene (VMAT1) to 8p21.3 and the brain SVAT gene (OMIM Ref. No. 193001) to 10q25. This gene is also symbolized as SLC18A1. Roghani et al. (1996) showed that the mouse Slc18a1 gene maps to mouse chromosome 8 by linkage analysis.

- [1502] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:
- [1503] Peter, D.; Finn, J. P.; Klisak, I.; Liu, Y.; Kojis, T.; Heinzmann, C.; Roghani, A.; Sparkes, R. S.; Edwards, R. H. : Chromosomal localization of the human vesicular amine transporter genes. *Genomics* 18: 720–723, 1993. ; and

- [1505] Further studies establishing the function and utilities of VAT1 are found in John Hopkins OMIM database record ID 193002, and in cited publications numbered 2400–2401

listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Allograft Inflammatory Factor 1 (AIF1, Accession NM_032955) is another VGAM55 host target gene. AIF1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by AIF1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AIF1 BINDING SITE, designated SEQ ID:2297, to the nucleotide sequence of VGAM55 RNA, herein designated VGAM RNA, also designated SEQ ID:390.

[1506] Another function of VGAM55 is therefore inhibition of Allograft Inflammatory Factor 1 (AIF1, Accession NM_032955). Accordingly, utilities of VGAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AIF1. Complexin 1 (CPLX1, Accession NM_006651) is another VGAM55 host target gene. CPLX1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CPLX1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide se-

quences of CPLX1 BINDING SITE, designated SEQ ID:1317, to the nucleotide sequence of VGAM55 RNA, herein designated VGAM RNA, also designated SEQ ID:390.

[1507] Another function of VGAM55 is therefore inhibition of Complexin 1 (CPLX1, Accession NM_006651). Accordingly, utilities of VGAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CPLX1. CXYorf1 (Accession XM_088704) is another VGAM55 host target gene. CXYorf1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CXYorf1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CXYorf1 BINDING SITE, designated SEQ ID:3228, to the nucleotide sequence of VGAM55 RNA, herein designated VGAM RNA, also designated SEQ ID:390.

[1508] Another function of VGAM55 is therefore inhibition of CXYorf1 (Accession XM_088704). Accordingly, utilities of VGAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CXYorf1. FLJ12221 (Accession XM_031342) is another VGAM55 host target gene. FLJ12221 BINDING SITE is HOST TARGET

binding site found in the 3' untranslated region of mRNA encoded by FLJ12221, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12221 BINDING SITE, designated SEQ ID:2637, to the nucleotide sequence of VGAM55 RNA, herein designated VGAM RNA, also designated SEQ ID:390.

[1509] Another function of VGAM55 is therefore inhibition of FLJ12221 (Accession XM_031342). Accordingly, utilities of VGAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12221. FLJ20207 (Accession NM_017711) is another VGAM55 host target gene. FLJ20207 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20207, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20207 BINDING SITE, designated SEQ ID:1741, to the nucleotide sequence of VGAM55 RNA, herein designated VGAM RNA, also designated SEQ ID:390.

[1510] Another function of VGAM55 is therefore inhibition of

FLJ20207 (Accession NM_017711). Accordingly, utilities of VGAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20207. FLJ22215 (Accession XM_173021) is another VGAM55 host target gene. FLJ22215 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ22215, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22215 BINDING SITE, designated SEQ ID:3715, to the nucleotide sequence of VGAM55 RNA, herein designated VGAM RNA, also designated SEQ ID:390.

[1511] Another function of VGAM55 is therefore inhibition of FLJ22215 (Accession XM_173021). Accordingly, utilities of VGAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22215. FLJ31547 (Accession NM_145024) is another VGAM55 host target gene. FLJ31547 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ31547, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of FLJ31547 BINDING SITE, designated SEQ ID:2511, to the nucleotide sequence of VGAM55 RNA, herein designated VGAM RNA, also designated SEQ ID:390.

[1512] Another function of VGAM55 is therefore inhibition of FLJ31547 (Accession NM_145024). Accordingly, utilities of VGAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ31547. HSCBCIP1 (Accession XM_114210) is another VGAM55 host target gene. HSCBCIP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HSCBCIP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HSCBCIP1 BINDING SITE, designated SEQ ID:3449, to the nucleotide sequence of VGAM55 RNA, herein designated VGAM RNA, also designated SEQ ID:390.

[1513] Another function of VGAM55 is therefore inhibition of HSCBCIP1 (Accession XM_114210). Accordingly, utilities of VGAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HSCBCIP1. KIAA0515 (Accession XM_033380) is another VGAM55

host target gene. KIAA0515 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA0515, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0515 BINDING SITE, designated SEQ ID:2670, to the nucleotide sequence of VGAM55 RNA, herein designated VGAM RNA, also designated SEQ ID:390.

[1514] Another function of VGAM55 is therefore inhibition of KIAA0515 (Accession XM_033380). Accordingly, utilities of VGAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0515. KIAA1514 (Accession NM_019064) is another VGAM55 host target gene. KIAA1514 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1514, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1514 BINDING SITE, designated SEQ ID:1877, to the nucleotide sequence of VGAM55 RNA, herein designated VGAM RNA, also designated SEQ ID:390.

[1515] Another function of VGAM55 is therefore inhibition of KIAA1514 (Accession NM_019064). Accordingly, utilities of VGAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1514. KIAA1553 (Accession XM_166320) is another VGAM55 host target gene. KIAA1553 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1553, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1553 BINDING SITE, designated SEQ ID:3544, to the nucleotide sequence of VGAM55 RNA, herein designated VGAM RNA, also designated SEQ ID:390.

[1516] Another function of VGAM55 is therefore inhibition of KIAA1553 (Accession XM_166320). Accordingly, utilities of VGAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1553. KIAA1656 (Accession XM_038022) is another VGAM55 host target gene. KIAA1656 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1656, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1656 BINDING SITE, designated SEQ ID:2730, to the nucleotide sequence of VGAM55 RNA, herein designated VGAM RNA, also designated SEQ ID:390.

[1517] Another function of VGAM55 is therefore inhibition of KIAA1656 (Accession XM_038022). Accordingly, utilities of VGAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1656. KIAA1877 (Accession XM_038616) is another VGAM55 host target gene. KIAA1877 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1877, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1877 BINDING SITE, designated SEQ ID:2741, to the nucleotide sequence of VGAM55 RNA, herein designated VGAM RNA, also designated SEQ ID:390.

[1518] Another function of VGAM55 is therefore inhibition of KIAA1877 (Accession XM_038616). Accordingly, utilities of VGAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA1877. MTCH1 (Accession NM_014341) is another VGAM55 host target gene. MTCH1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MTCH1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MTCH1 BINDING SITE, designated SEQ ID:1493, to the nucleotide sequence of VGAM55 RNA, herein designated VGAM RNA, also designated SEQ ID:390.

[1519] Another function of VGAM55 is therefore inhibition of MTCH1 (Accession NM_014341). Accordingly, utilities of VGAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MTCH1. N-PAC (Accession XM_048113) is another VGAM55 host target gene. N-PAC BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by N-PAC, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of N-PAC BINDING SITE, designated SEQ ID:2902, to the nucleotide sequence of VGAM55 RNA, herein designated VGAM RNA, also designated SEQ

ID:390.

[1520] Another function of VGAM55 is therefore inhibition of N-PAC (Accession XM_048113). Accordingly, utilities of VGAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with N-PAC. Sema Domain, Immunoglobulin Domain (Ig), Transmembrane Domain (TM) and Short Cytoplasmic Domain, (semaphorin) 4B (SEMA4B, Accession XM_044533) is another VGAM55 host target gene. SEMA4B BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by SEMA4B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SEMA4B BINDING SITE, designated SEQ ID:2839, to the nucleotide sequence of VGAM55 RNA, herein designated VGAM RNA, also designated SEQ ID:390.

[1521] Another function of VGAM55 is therefore inhibition of Sema Domain, Immunoglobulin Domain (Ig), Transmembrane Domain (TM) and Short Cytoplasmic Domain, (semaphorin) 4B (SEMA4B, Accession XM_044533). Accordingly, utilities of VGAM55 include diagnosis, prevention and treatment of diseases and clinical conditions as-

sociated with SEMA4B. Sprouty Homolog 1, Antagonist of FGF Signaling (Drosophila) (SPRY1, Accession XM_036349) is another VGAM55 host target gene. SPRY1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SPRY1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SPRY1 BINDING SITE, designated SEQ ID:2709, to the nucleotide sequence of VGAM55 RNA, herein designated VGAM RNA, also designated SEQ ID:390.

[1522] Another function of VGAM55 is therefore inhibition of Sprouty Homolog 1, Antagonist of FGF Signaling (Drosophila) (SPRY1, Accession XM_036349). Accordingly, utilities of VGAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SPRY1. WS-3 (Accession NM_006571) is another VGAM55 host target gene. WS-3 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by WS-3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of WS-3 BINDING SITE,

designated SEQ ID:1312, to the nucleotide sequence of VGAM55 RNA, herein designated VGAM RNA, also designated SEQ ID:390.

[1523] Another function of VGAM55 is therefore inhibition of WS-3 (Accession NM_006571). Accordingly, utilities of VGAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with WS-3. LOC123242 (Accession XM_063548) is another VGAM55 host target gene. LOC123242 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC123242, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC123242 BINDING SITE, designated SEQ ID:3030, to the nucleotide sequence of VGAM55 RNA, herein designated VGAM RNA, also designated SEQ ID:390.

[1524] Another function of VGAM55 is therefore inhibition of LOC123242 (Accession XM_063548). Accordingly, utilities of VGAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC123242. LOC127702 (Accession XM_060619) is another VGAM55 host target gene. LOC127702 BINDING

SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC127702, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC127702 BINDING SITE, designated SEQ ID:3024, to the nucleotide sequence of VGAM55 RNA, herein designated VGAM RNA, also designated SEQ ID:390.

[1525] Another function of VGAM55 is therefore inhibition of LOC127702 (Accession XM_060619). Accordingly, utilities of VGAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC127702. LOC146745 (Accession XM_085577) is another VGAM55 host target gene. LOC146745 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC146745, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146745 BINDING SITE, designated SEQ ID:3099, to the nucleotide sequence of VGAM55 RNA, herein designated VGAM RNA, also designated SEQ ID:390.

[1526] Another function of VGAM55 is therefore inhibition of

LOC146745 (Accession XM_085577). Accordingly, utilities of VGAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146745. LOC147791 (Accession XM_097293) is another VGAM55 host target gene. LOC147791 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC147791, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147791 BINDING SITE, designated SEQ ID:3294, to the nucleotide sequence of VGAM55 RNA, herein designated VGAM RNA, also designated SEQ ID:390.

[1527] Another function of VGAM55 is therefore inhibition of LOC147791 (Accession XM_097293). Accordingly, utilities of VGAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147791. LOC196892 (Accession XM_113768) is another VGAM55 host target gene. LOC196892 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC196892, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC196892 BINDING SITE, designated SEQ ID:3417, to the nucleotide sequence of VGAM55 RNA, herein designated VGAM RNA, also designated SEQ ID:390.

[1528] Another function of VGAM55 is therefore inhibition of LOC196892 (Accession XM_113768). Accordingly, utilities of VGAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196892. LOC200093 (Accession XM_032184) is another VGAM55 host target gene. LOC200093 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC200093, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200093 BINDING SITE, designated SEQ ID:2648, to the nucleotide sequence of VGAM55 RNA, herein designated VGAM RNA, also designated SEQ ID:390.

[1529] Another function of VGAM55 is therefore inhibition of LOC200093 (Accession XM_032184). Accordingly, utilities of VGAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200093. LOC201243 (Accession XM_113935) is an-

other VGAM55 host target gene. LOC201243 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC201243, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC201243 BINDING SITE, designated SEQ ID:3426, to the nucleotide sequence of VGAM55 RNA, herein designated VGAM RNA, also designated SEQ ID:390.

[1530] Another function of VGAM55 is therefore inhibition of LOC201243 (Accession XM_113935). Accordingly, utilities of VGAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201243. LOC219404 (Accession XM_167909) is another VGAM55 host target gene. LOC219404 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC219404, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219404 BINDING SITE, designated SEQ ID:3606, to the nucleotide sequence of VGAM55 RNA, herein designated VGAM RNA, also designated SEQ ID:390.

[1531] Another function of VGAM55 is therefore inhibition of LOC219404 (Accession XM_167909). Accordingly, utilities of VGAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219404. LOC222066 (Accession XM_166582) is another VGAM55 host target gene. LOC222066 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC222066, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222066 BINDING SITE, designated SEQ ID:3574, to the nucleotide sequence of VGAM55 RNA, herein designated VGAM RNA, also designated SEQ ID:390.

[1532] Another function of VGAM55 is therefore inhibition of LOC222066 (Accession XM_166582). Accordingly, utilities of VGAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222066. LOC253001 (Accession XM_171711) is another VGAM55 host target gene. LOC253001 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC253001, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253001 BINDING SITE, designated SEQ ID:3698, to the nucleotide sequence of VGAM55 RNA, herein designated VGAM RNA, also designated SEQ ID:390.

[1533] Another function of VGAM55 is therefore inhibition of LOC253001 (Accession XM_171711). Accordingly, utilities of VGAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253001. LOC91040 (Accession XM_035641) is another VGAM55 host target gene. LOC91040 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC91040, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91040 BINDING SITE, designated SEQ ID:2700, to the nucleotide sequence of VGAM55 RNA, herein designated VGAM RNA, also designated SEQ ID:390.

[1534] Another function of VGAM55 is therefore inhibition of LOC91040 (Accession XM_035641). Accordingly, utilities of VGAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC91040. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 56 (VGAM56) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[1535] VGAM56 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM56 was detected is described hereinabove with reference to Figs. 1–8.

[1536] VGAM56 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus. VGAM56 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[1537] VGAM56 gene encodes a VGAM56 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM56 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM56 precursor RNA is designated SEQ ID:42, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:42 is

located at position 183817 relative to the genome of Vac-
cinia Virus.

[1538] VGAM56 precursor RNA folds onto itself, forming VGAM56 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[1539] An enzyme complex designated DICER COMPLEX, `dices` the VGAM56 folded precursor RNA into VGAM56 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM56 RNA is designated SEQ ID:391, and is provided hereinbelow with reference to the sequence listing part.

[1540] VGAM56 host target gene, herein designated VGAM HOST

TARGET GENE, encodes a corresponding messenger RNA, VGAM56 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM56 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[1541] VGAM56 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM56 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM56 RNA is an accurate or a partial inverted-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM56 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM56 host target RNA, herein designated VGAM

HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR and 5' UTR regions.

[1542] The complementary binding of VGAM56 RNA, herein designated VGAM RNA, to host target binding sites on VGAM56 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM56 host target RNA into VGAM56 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[1543] It is appreciated that VGAM56 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM56 host target genes. The mRNA of each one of this plurality of VGAM56 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM56 RNA, herein designated VGAM RNA, and which when bound by VGAM56 RNA causes inhibition of translation of respective one or more VGAM56 host target proteins.

[1544] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM56 gene, herein designated VGAM GENE, on one or more VGAM56 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[1545] It is yet further appreciated that a function of VGAM56 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM56 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM56 correlate with, and may be deduced from, the identity of the host

target genes which VGAM56 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[1546] Nucleotide sequences of the VGAM56 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM56 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM56 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM56 are further described hereinbelow with reference to Table 1.

[1547] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM56 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM56 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[1548] As mentioned hereinabove with reference to Fig. 1, a function of VGAM56 gene, herein designated VGAM is inhibition of expression of VGAM56 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM56 correlate with, and may be deduced from, the identity of the target genes which VGAM56 binds and in-

hibits, and the function of these target genes, as elaborated hereinbelow.

[1549] Glucosaminyl (N-acetyl) Transferase 2, I-branching Enzyme (GCNT2, Accession NM_001491) is a VGAM56 host target gene. GCNT2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by GCNT2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GCNT2 BINDING SITE, designated SEQ ID:831, to the nucleotide sequence of VGAM56 RNA, herein designated VGAM RNA, also designated SEQ ID:391.

[1550] A function of VGAM56 is therefore inhibition of Glucosaminyl (N-acetyl) Transferase 2, I-branching Enzyme (GCNT2, Accession NM_001491), a gene which converts linear into branched poly-n-acetyllactosaminoglycans. Accordingly, utilities of VGAM56 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GCNT2. The function of GCNT2 has been established by previous studies. The blood group i/I antigens were the first identified alloantigens that display a dramatic change during human development (OMIM Ref.

No. 110800). The i and I antigens are determined by linear and branched poly-N-acetyllactosaminoglycans, respectively. In human erythrocytes during embryonic development, the fetal (i) antigen is replaced by the adult (I) antigen as the result of the appearance of a beta-1,6-N-acetylglucosaminyltransferase, the I-branching enzyme (GCNT2). Bierhuizen et al. (1993) cloned the cDNA for the branching enzyme that converts the linear form into the branched form and studied its expression with development of I antigen in transfected cells. The cDNA sequence predicted a protein of type II membrane topology as has been found for all other mammalian glycosyltransferases. Comparison of the amino acid sequence with those of other glycosyltransferases revealed that this I-branching enzyme and another beta-1,6,N-acetylglucosaminyltransferase that forms a branch in O-glycans (GCNT1; 600391) are strongly homologous in the center of their putative catalytic domains.

[1551] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[1552] Bierhuizen, M. F. A.; Mattei, M.-G.; Fukuda, M. : Expression of the developmental I antigen by a cloned human

cDNA encoding a member of a beta-1,6-N-acetylglucosaminyltransferase gene family. Genes Dev. 7: 468-478, 1993. ; and

- [1553] Lin-Chu, M.; Broadberry, R. E.; Okubo, Y.; Tanaka, M. : The i phenotype and congenital cataracts among Chinese in Taiwan (Letter) Transfusion 31: 676-677, 1991.
- [1554] Further studies establishing the function and utilities of GCNT2 are found in John Hopkins OMIM database record ID 600429, and in cited publications numbered 2828-2830, 1044, 172 and 2831-2832 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. BLP1 (Accession NM_031940) is another VGAM56 host target gene. BLP1 BINDING SITE1 and BLP1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by BLP1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BLP1 BINDING SITE1 and BLP1 BINDING SITE2, designated SEQ ID:2222 and SEQ ID:2371 respectively, to the nucleotide sequence of VGAM56 RNA, herein designated VGAM RNA, also designated SEQ ID:391.
- [1555] Another function of VGAM56 is therefore inhibition of

BLP1 (Accession NM_031940). Accordingly, utilities of VGAM56 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BLP1. LOC253891 (Accession XM_170485) is another VGAM56 host target gene. LOC253891 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC253891, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253891 BINDING SITE, designated SEQ ID:3654, to the nucleotide sequence of VGAM56 RNA, herein designated VGAM RNA, also designated SEQ ID:391.

[1556] Another function of VGAM56 is therefore inhibition of LOC253891 (Accession XM_170485). Accordingly, utilities of VGAM56 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253891. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 57 (VGAM57) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is

known in the art.

[1557] VGAM57 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM57 was detected is described hereinabove with reference to Figs. 1–8.

[1558] VGAM57 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus. VGAM57 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[1559] VGAM57 gene encodes a VGAM57 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM57 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM57 precursor RNA is designated SEQ ID:43, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:43 is located at position 183735 relative to the genome of Vaccinia Virus.

[1560] VGAM57 precursor RNA folds onto itself, forming VGAM57 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin struc-

ture`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[1561] An enzyme complex designated DICER COMPLEX, `dices` the VGAM57 folded precursor RNA into VGAM57 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 71%) nucleotide sequence of VGAM57 RNA is designated SEQ ID:392, and is provided hereinbelow with reference to the sequence listing part.

[1562] VGAM57 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM57 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM57 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING

and 3`UTR respectively.

[1563] VGAM57 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM57 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM57 RNA is an accurate or a partial inverted-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM57 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM57 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[1564] The complementary binding of VGAM57 RNA, herein des-

ignated VGAM RNA, to host target binding sites on VGAM57 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM57 host target RNA into VGAM57 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[1565] It is appreciated that VGAM57 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM57 host target genes. The mRNA of each one of this plurality of VGAM57 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM57 RNA, herein designated VGAM RNA, and which when bound by VGAM57 RNA causes inhibition of translation of respective one or more VGAM57 host target proteins.

[1566] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM57 gene, herein designated VGAM GENE, on one or more VGAM57 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known

non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[1567] It is yet further appreciated that a function of VGAM57 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM57 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM57 correlate with, and may be deduced from, the identity of the host target genes which VGAM57 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[1568] Nucleotide sequences of the VGAM57 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM57 RNA, herein designated VGAM RNA, and

a schematic representation of the secondary folding of VGAM57 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM57 are further described hereinbelow with reference to Table 1.

[1569] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM57 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM57 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[1570] As mentioned hereinabove with reference to Fig. 1, a function of VGAM57 gene, herein designated VGAM is inhibition of expression of VGAM57 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM57 correlate with, and may be deduced from, the identity of the target genes which VGAM57 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[1571] Adenylosuccinate Synthase (ADSS, Accession XM_049992) is a VGAM57 host target gene. ADSS BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ADSS, corresponding to a HOST

TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ADSS BINDING SITE, designated SEQ ID:2925, to the nucleotide sequence of VGAM57 RNA, herein designated VGAM RNA, also designated SEQ ID:392.

[1572] A function of VGAM57 is therefore inhibition of Adenylosuccinate Synthase (ADSS, Accession XM_049992), a gene which plays an important role in the de novo pathway of purine nucleotide biosynthesis. Accordingly, utilities of VGAM57 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADSS. The function of ADSS has been established by previous studies. Somatic cell hybrids between human cells and Chinese hamster ovary cells deficient in specific steps in the purine biosynthetic pathway permitted mapping of human genes correcting the defects. The ade(-)H mutant is missing the enzyme adenylosuccinate synthetase (IMP:L-aspartate ligase; EC 6.3.4.4.), which carries out the first of a 2-step sequence in the biosynthesis of AMP from IMP. Thus, ade(-)H cells require exogenous adenine for growth. Lai et al. (1989) found that in somatic cell hybrids human chromosome 1 corrected the defect so that the hybrid cell

containing chromosome 1 grew without adenine. Lai et al. (1991) reported that analysis of a human/CHO translocation chromosome that arose in 1 of the hybrids suggested that the gene correcting the defect lies in the region 1cen-q12. (See their Figure 1 for a useful diagram of the purine biosynthesis pathway and the purine nucleotide cycle pathway, together with the location of the genes for the enzymes when known.) AMP deaminase, which converts AMP back to IMP, is coded by a gene, perhaps 2 genes, in region 1p21-p13; see 102770. From a human liver library, Powell et al. (1992) isolated a cDNA that encoded a protein of 455 amino acids. Alignment with the sequence of the ADSS gene in mouse, *Dictyostelium discoideum*, and *E. coli* pointed to invariant residues that are likely to be important for structure and/or catalysis. The human ADSS sequence also showed some similarity to argininosuccinate synthetase, which catalyzes a chemically similar reaction.

[1573] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[1574] Lai, L.-W.; Hart, I. M.; Patterson, D. : A gene correcting the defect in the CHO mutant Ade(-)H, deficient in a branch

point enzyme (adenylosuccinate synthetase) of de novo purine biosynthesis, is located on the long arm of chromosome 1. Genomics 9: 322–328, 1991. ; and

[1575] Powell, S. M.; Zalkin, H.; Dixon, J. E. : Cloning and characterization of the cDNA encoding human adenylosuccinate synthetase. FEBS Lett. 303: 4–10, 1992.

[1576] Further studies establishing the function and utilities of ADSS are found in John Hopkins OMIM database record ID 103060, and in cited publications numbered 81–83 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Caspase 6, Apoptosis-related Cysteine Protease (CASP6, Accession NM_032992) is another VGAM57 host target gene. CASP6 BINDING SITE1 and CASP6 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by CASP6, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CASP6 BINDING SITE1 and CASP6 BINDING SITE2, designated SEQ ID:2305 and SEQ ID:810 respectively, to the nucleotide sequence of VGAM57 RNA, herein designated VGAM RNA, also designated SEQ ID:392.

[1577] Another function of VGAM57 is therefore inhibition of

Caspase 6, Apoptosis-related Cysteine Protease (CASP6, Accession NM_032992), a gene which involves in the activation cascade of caspases responsible for apoptosis execution. Accordingly, utilities of VGAM57 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CASP6. The function of CASP6 has been established by previous studies. Fernandes-Alnemri et al. (1995) isolated MCH2, a member of the ced-3 subfamily of apoptotic proteases, by performing PCR on human Jurkat T lymphocytes using degenerate oligonucleotides corresponding to conserved peptides in known apoptotic cysteine proteases. The gene, also symbolized CASP6, encodes a 34-kD protein that is highly homologous to human CPP32 (OMIM Ref. No. 600636), *C. elegans* ced-3, mammalian Ich1/Nedd2 (OMIM Ref. No. 600639), and mammalian interleukin-1-beta converting enzyme (OMIM Ref. No. 147678). Fernandes-Alnemri et al. (1995) observed 1.7-kb (alpha) and 1.4-kb (beta) transcripts expressed in Jurkat lymphocytes and other cell lines. The authors suggested that these transcripts are alternate splicing variants and found that the alpha, but not the beta, MCH2 protein has protease activity. They also found that MCH2-alpha protein can cleave poly(ADP-ribose)

polymerase (OMIM Ref. No. 173870) in vitro and that its overexpression induces apoptosis in insect Sf9 cells, suggesting that MCH2 is a mediator of apoptosis in mammalian cells. Using protease assays and immunoblotting experiments, Orth et al. (1996) showed that MCH2, like CPP32 and MCH3, functions downstream of the mammalian cell death inhibitors Bcl2 (OMIM Ref. No. 151430) and BclXL and of the viral serpin CrmA. Further, they found that granzyme B can functionally activate MCH2, supporting the idea that granzyme B kills cells by activating downstream components of the CED-3/ICE apoptotic pathway. Orth et al. (1996) also showed that MCH2, unlike CPP32 and MCH3, can cleave lamin A to its signature apoptotic fragment.

[1578] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[1579] Fernandes-Alnemri, T.; Litwack, G.; Alnemri, E. S. : Mch2, a new member of the apoptotic Ced-3/Ice cysteine protease gene family. Cancer Res. 55: 2737-2742, 1995. ; and

[1580] Orth, K.; Chinnaiyan, A. M.; Garg, M.; Froelich, C. J.; Dixit, V. M. : The CED-3/ICE-like protease Mch2 is activated

during apoptosis and cleaves the death substrate lamin A.
J. Biol. Ch.

[1581] Further studies establishing the function and utilities of CASP6 are found in John Hopkins OMIM database record ID 601532, and in cited publications numbered 1637, 163 and 1639 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Coagulation Factor II (thrombin) Receptor (F2R, Accession NM_001992) is another VGAM57 host target gene. F2R BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by F2R, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of F2R BINDING SITE, designated SEQ ID:879, to the nucleotide sequence of VGAM57 RNA, herein designated VGAM RNA, also designated SEQ ID:392.

[1582] Another function of VGAM57 is therefore inhibition of Coagulation Factor II (thrombin) Receptor (F2R, Accession NM_001992), a gene which Thrombin receptor; G protein-coupled receptor involved in platelet activation. Accordingly, utilities of VGAM57 include diagnosis, prevention and treatment of diseases and clinical conditions associ-

ated with F2R. The function of F2R has been established by previous studies. Coughlin et al. (1992) reviewed the cloning and characterization of a platelet thrombin (OMIM Ref. No. 176930) receptor (Vu et al., 1991). The thrombin receptor is structurally related to other members of the 7-transmembrane receptor family and has been isolated from diverse cell types. It is intimately involved in the regulation of the thrombotic response. Using PCR analyses of a human/rodent hybrid cell mapping panel, Bahou et al. (1993) assigned the TR gene to chromosome 5. By fluorescence in situ hybridization, they refined the localization to 5q13, confirming its presence as a single locus in the human genome. Poirier et al. (1996) mapped the Cf2r gene to mouse chromosome 13 by studies of an interspecific backcross. Utilizing 2 distinct radiation hybrid mapping panels with different levels of resolution, Schmidt et al. (1997) demonstrated that this gene, sometimes referred to as PAR1, and the proteinase activated receptor-2 gene (OMIM Ref. No. 600933) are tightly linked. Physical mapping using yeast artificial chromosomes and inversion field gel electrophoresis demonstrated that they are maximally separated by 90 kb. Riewald et al. (2002) demonstrated that activated protein C (OMIM Ref. No. 176860)

uses the endothelial cell protein C receptor (EPCR; 600646) as a coreceptor for cleavage of protease-activated receptor 1 (PAR1) on endothelial cells. Gene profiling demonstrated that PAR1 signaling could account for all activated protein C-induced protective genes, including the immunomodulatory monocyte chemoattractant protein-1 (MCP1; 158105), which was selectively induced by activation of PAR1, but not PAR2 (OMIM Ref. No. 600933). Thus, Riewald et al. (2002) concluded that the prototypical thrombin receptor is the target for EPCR-dependent APC signaling, suggesting a role for this receptor cascade in protection from sepsis. Animal model experiments lend further support to the function of F2R. Griffin et al. (2001) reported a role for Par1, a protease-activated G protein-coupled receptor for thrombin, in embryonic development. Approximately one-half of Par1 $-/-$ embryos died at midgestation with bleeding from multiple sites. Par1 is expressed in endothelial cells, and a Par1 transgene driven by an endothelial-specific promoter prevented death of Par1 $-/-$ embryos. Griffin et al. (2001) concluded that the coagulation cascade and PAR1 modulate endothelial cell function in developing blood vessels and that thrombin's actions on endothelial cells, rather than

on platelets, mesenchymal cells, or fibrinogen (see OMIM Ref. No. 134820), contribute to vascular development and hemostasis in the mouse embryo.

[1583] It is appreciated that the abovementioned animal model for F2R is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[1584] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[1585] Coughlin, S. R.; Vu, T.-K. H.; Hung, D. T.; Wheaton, V. I. : Characterization of a functional thrombin receptor: issues and opportunities. J. Clin. Invest. 89: 351-355, 1992. ; and

[1586] Riewald, M.; Petrovan, R. J.; Donner, A.; Mueller, B. M.; Ruf, W. : Activation of endothelial cell protease activated receptor 1 by the protein C pathway. Science 296: 1880-1882, 2002.

[1587] Further studies establishing the function and utilities of F2R are found in John Hopkins OMIM database record ID 187930, and in cited publications numbered 367-37 and 1330-373 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. G Pro-

tein-coupled Receptor Kinase 7 (GPRK7, Accession NM_139209) is another VGAM57 host target gene. GPRK7 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GPRK7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GPRK7 BINDING SITE, designated SEQ ID:2476, to the nucleotide sequence of VGAM57 RNA, herein designated VGAM RNA, also designated SEQ ID:392.

[1588] Another function of VGAM57 is therefore inhibition of G Protein-coupled Receptor Kinase 7 (GPRK7, Accession NM_139209), a gene which regulates the G protein-coupled receptors. Accordingly, utilities of VGAM57 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GPRK7. The function of GPRK7 has been established by previous studies. By PCR on neutrophil cDNA using primers based on sequences of known receptor kinases, Haribabu and Snyderman (1993) identified sequences for GPRK5 (OMIM Ref. No. 600870), GPRK6 (OMIM Ref. No. 600869), and what they believed to be GPRK7. The sequence designated GPRK7 showed the least homology to known receptor kinases and was later

determined to match the sequence of mitogen-activated protein kinase-interacting serine/threonine kinase-2 (MKNK2). MKNK2 contains conserved DLG (asp-leu-gly) and ENIL (glu-asn-ile-leu) motifs. Using a 2-hybrid screen for Erk2 (MAPK1; 176948)-binding proteins, Waskiewicz et al. (1997) identified mouse Mnk2 and isolated a full-length cDNA clone from a mouse embryo cDNA library. Mnk2 has a conserved C-terminal Erk-interacting domain, a catalytic domain with homology to the calcium/calmodulin-dependent family of kinases, and putative MAP kinase phosphorylation sites located within the T loop of the kinase domain. Northern blot analysis detected Mnk2 expression in all adult mouse tissues tested except brain, where levels were greatly reduced. Expression was especially abundant in skeletal muscle.

[1589] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[1590] Haribabu, B.; Snyderman, R. : Identification of additional members of human G-protein-coupled receptor kinase multigene family. Proc. Nat. Acad. Sci. 90: 9398-9402, 1993. ; and

Mitogen-activated protein kinases activate the serine/threonine kinases Mnk1 and Mnk2. EMBO J. 16: 1909-1920, 1997.

[1592] Further studies establishing the function and utilities of GPRK7 are found in John Hopkins OMIM database record ID 605069, and in cited publications numbered 1614 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Neuroligin 1 (NLGN1, Accession NM_014932) is another VGAM57 host target gene. NLGN1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NLGN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NLGN1 BINDING SITE, designated SEQ ID:1591, to the nucleotide sequence of VGAM57 RNA, herein designated VGAM RNA, also designated SEQ ID:392.

[1593] Another function of VGAM57 is therefore inhibition of Neuroligin 1 (NLGN1, Accession NM_014932), a gene which may trigger the de novo formation of presynaptic structure. Accordingly, utilities of VGAM57 include diagnosis, prevention and treatment of diseases and clinical

conditions associated with NLGN1. The function of NLGN1 has been established by previous studies. Neurexins (see OMIM Ref. No. NRXN1; 600565) are neuronal cell surface proteins first identified in rat brain with hundreds of isoforms generated by alternative splicing. Ichtchenko et al. (1995) described neuroligin I, a neuronal cell surface protein that is enriched in rat synaptic plasma membranes and acts as a splice site-specific ligand for beta-neurexins. (Each of 3 genes encoding neurexins--NRXN1, NRXN2, and NRXN3--has 2 independent promoters and generates 2 classes of mRNAs. The longer mRNAs encode alpha-neurexins and the shorter mRNAs beta-neurexins.) Neuroligin I binds to beta-neurexins only if they lack an insert in the alternatively spliced sequence of the G domain, and not if they contain an insert. The extracellular sequence of rat neuroligin I is composed of a catalytically inactive esterase domain homologous to acetylcholinesterase. Ichtchenko et al. (1995) used in situ hybridization to demonstrate that alternative splicing of neurexins at the binding site recognized by neuroligin I is highly regulated. These findings support a model whereby alternative splicing of neurexins creates a family of cell surface receptors that confer interactive specificity on

their resident neurons. Using an in vitro system, Scheiffele et al. (2000) demonstrated that mouse neuroligin-1 and -2, postsynaptically localized proteins, can trigger the de novo formation of presynaptic structure. Nonneuronal cells engineered to express neuroligins induced morphologic and functional presynaptic differentiation in contacting axons. This activity could be inhibited by addition of a soluble version of beta-neurexin. Furthermore, addition of soluble beta-neurexin to a coculture of defined pre- and postsynaptic central nervous system (CNS) neurons inhibited synaptic vesicle clustering in axons contacting target neurons. These results suggested that neuroligins are part of the machinery employed during the formation and remodeling of CNS synapses.

[1594] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[1595] Ichtchenko, K.; Hata, Y.; Nguyen, T.; Ullrich, B.; Missler, M.; Moomaw, C.; Sudhof, T. C. : Neuroligin 1: a splice site-specific ligand for beta-neurexins. *Cell* 81: 435-443, 1995. ; and

[1596] Scheiffele, P.; Fan, J.; Choih, J.; Fetter, R.; Serafini, T. : Neuroligin expressed in nonneuronal cells triggers presy-

naptic development in contacting axons. Cell 101: 657–669, 2000.

[1597] Further studies establishing the function and utilities of NLGN1 are found in John Hopkins OMIM database record ID 600568, and in cited publications numbered 1860, 191 and 2150 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. APC10 (Accession NM_014885) is another VGAM57 host target gene. APC10 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by APC10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of APC10 BINDING SITE, designated SEQ ID:1574, to the nucleotide sequence of VGAM57 RNA, herein designated VGAM RNA, also designated SEQ ID:392.

[1598] Another function of VGAM57 is therefore inhibition of APC10 (Accession NM_014885). Accordingly, utilities of VGAM57 include diagnosis, prevention and treatment of diseases and clinical conditions associated with APC10. Chromosome 20 Open Reading Frame 139 (C20orf139, Accession XM_097749) is another VGAM57 host target

gene. C20orf139 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C20orf139, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C20orf139 BINDING SITE, designated SEQ ID:3319, to the nucleotide sequence of VGAM57 RNA, herein designated VGAM RNA, also designated SEQ ID:392.

[1599] Another function of VGAM57 is therefore inhibition of Chromosome 20 Open Reading Frame 139 (C20orf139, Accession XM_097749). Accordingly, utilities of VGAM57 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf139. FLJ11186 (Accession NM_018353) is another VGAM57 host target gene. FLJ11186 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ11186, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11186 BINDING SITE, designated SEQ ID:1818, to the nucleotide sequence of VGAM57 RNA, herein designated VGAM RNA, also desig-

nated SEQ ID:392.

[1600] Another function of VGAM57 is therefore inhibition of FLJ11186 (Accession NM_018353). Accordingly, utilities of VGAM57 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11186. FLJ22116 (Accession NM_024624) is another VGAM57 host target gene. FLJ22116 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ22116, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22116 BINDING SITE, designated SEQ ID:2073, to the nucleotide sequence of VGAM57 RNA, herein designated VGAM RNA, also designated SEQ ID:392.

[1601] Another function of VGAM57 is therefore inhibition of FLJ22116 (Accession NM_024624). Accordingly, utilities of VGAM57 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22116. FLJ32978 (Accession NM_144625) is another VGAM57 host target gene. FLJ32978 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ32978, corresponding to a HOST TARGET

binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ32978 BINDING SITE, designated SEQ ID:2487, to the nucleotide sequence of VGAM57 RNA, herein designated VGAM RNA, also designated SEQ ID:392.

[1602] Another function of VGAM57 is therefore inhibition of FLJ32978 (Accession NM_144625). Accordingly, utilities of VGAM57 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ32978. KIAA1164 (Accession XM_045358) is another VGAM57 host target gene. KIAA1164 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1164, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1164 BINDING SITE, designated SEQ ID:2862, to the nucleotide sequence of VGAM57 RNA, herein designated VGAM RNA, also designated SEQ ID:392.

[1603] Another function of VGAM57 is therefore inhibition of KIAA1164 (Accession XM_045358). Accordingly, utilities of VGAM57 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with KIAA1164. KIAA1762 (Accession XM_033370) is another VGAM57 host target gene. KIAA1762 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1762, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1762 BINDING SITE, designated SEQ ID:2668, to the nucleotide sequence of VGAM57 RNA, herein designated VGAM RNA, also designated SEQ ID:392.

[1604] Another function of VGAM57 is therefore inhibition of KIAA1762 (Accession XM_033370). Accordingly, utilities of VGAM57 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1762. KIAA1918 (Accession XM_054951) is another VGAM57 host target gene. KIAA1918 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1918, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1918 BINDING SITE, designated SEQ ID:2969, to the

nucleotide sequence of VGAM57 RNA, herein designated VGAM RNA, also designated SEQ ID:392.

[1605] Another function of VGAM57 is therefore inhibition of KIAA1918 (Accession XM_054951). Accordingly, utilities of VGAM57 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1918. POPX1 (Accession NM_014906) is another VGAM57 host target gene. POPX1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by POPX1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of POPX1 BINDING SITE, designated SEQ ID:1583, to the nucleotide sequence of VGAM57 RNA, herein designated VGAM RNA, also designated SEQ ID:392.

[1606] Another function of VGAM57 is therefore inhibition of POPX1 (Accession NM_014906). Accordingly, utilities of VGAM57 include diagnosis, prevention and treatment of diseases and clinical conditions associated with POPX1. PRO0800 (Accession NM_018592) is another VGAM57 host target gene. PRO0800 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA

encoded by PRO0800, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO0800 BINDING SITE, designated SEQ ID:1852, to the nucleotide sequence of VGAM57 RNA, herein designated VGAM RNA, also designated SEQ ID:392.

[1607] Another function of VGAM57 is therefore inhibition of PRO0800 (Accession NM_018592). Accordingly, utilities of VGAM57 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO0800. LOC142779 (Accession XM_084337) is another VGAM57 host target gene. LOC142779 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC142779, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC142779 BINDING SITE, designated SEQ ID:3050, to the nucleotide sequence of VGAM57 RNA, herein designated VGAM RNA, also designated SEQ ID:392.

[1608] Another function of VGAM57 is therefore inhibition of LOC142779 (Accession XM_084337). Accordingly, utilities

of VGAM57 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC142779. LOC143274 (Accession XM_084477) is another VGAM57 host target gene. LOC143274 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC143274, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC143274 BINDING SITE, designated SEQ ID:3053, to the nucleotide sequence of VGAM57 RNA, herein designated VGAM RNA, also designated SEQ ID:392.

[1609] Another function of VGAM57 is therefore inhibition of LOC143274 (Accession XM_084477). Accordingly, utilities of VGAM57 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC143274. LOC154089 (Accession XM_087846) is another VGAM57 host target gene. LOC154089 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC154089, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC154089 BINDING SITE, designated SEQ ID:3186, to the nucleotide sequence of VGAM57 RNA, herein designated VGAM RNA, also designated SEQ ID:392.

[1610] Another function of VGAM57 is therefore inhibition of LOC154089 (Accession XM_087846). Accordingly, utilities of VGAM57 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC154089. LOC169679 (Accession XM_108982) is another VGAM57 host target gene. LOC169679 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC169679, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC169679 BINDING SITE, designated SEQ ID:3404, to the nucleotide sequence of VGAM57 RNA, herein designated VGAM RNA, also designated SEQ ID:392.

[1611] Another function of VGAM57 is therefore inhibition of LOC169679 (Accession XM_108982). Accordingly, utilities of VGAM57 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC169679. LOC202052 (Accession XM_117355) is another VGAM57 host target gene. LOC202052 BINDING

SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC202052, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC202052 BINDING SITE, designated SEQ ID:3484, to the nucleotide sequence of VGAM57 RNA, herein designated VGAM RNA, also designated SEQ ID:392.

[1612] Another function of VGAM57 is therefore inhibition of LOC202052 (Accession XM_117355). Accordingly, utilities of VGAM57 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC202052. LOC256021 (Accession XM_172884) is another VGAM57 host target gene. LOC256021 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC256021, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256021 BINDING SITE, designated SEQ ID:3708, to the nucleotide sequence of VGAM57 RNA, herein designated VGAM RNA, also designated SEQ ID:392.

[1613] Another function of VGAM57 is therefore inhibition of

LOC256021 (Accession XM_172884). Accordingly, utilities of VGAM57 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256021. LOC91650 (Accession XM_039853) is another VGAM57 host target gene. LOC91650 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC91650, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91650 BINDING SITE, designated SEQ ID:2765, to the nucleotide sequence of VGAM57 RNA, herein designated VGAM RNA, also designated SEQ ID:392.

[1614] Another function of VGAM57 is therefore inhibition of LOC91650 (Accession XM_039853). Accordingly, utilities of VGAM57 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91650. LOC91752 (Accession XM_040403) is another VGAM57 host target gene. LOC91752 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC91752, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of LOC91752 BINDING SITE, designated SEQ ID:2777, to the nucleotide sequence of VGAM57 RNA, herein designated VGAM RNA, also designated SEQ ID:392.

[1615] Another function of VGAM57 is therefore inhibition of LOC91752 (Accession XM_040403). Accordingly, utilities of VGAM57 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91752. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 58 (VGAM58) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[1616] VGAM58 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM58 was detected is described hereinabove with reference to Figs. 1–8.

[1617] VGAM58 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus. VGAM58 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[1618] VGAM58 gene encodes a VGAM58 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM58 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM58 precursor RNA is designated SEQ ID:44, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:44 is located at position 9636 relative to the genome of Vaccinia Virus.

[1619] VGAM58 precursor RNA folds onto itself, forming VGAM58 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[1620] An enzyme complex designated DICER COMPLEX, `dices` the VGAM58 folded precursor RNA into VGAM58 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 71%) nucleotide sequence of VGAM58 RNA is designated SEQ ID:393, and is provided hereinbelow with reference to the sequence listing part.

[1621] VGAM58 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM58 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM58 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[1622] VGAM58 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM58 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM58 RNA is an accurate or a partial inverted-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration,

Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM58 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM58 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[1623] The complementary binding of VGAM58 RNA, herein designated VGAM RNA, to host target binding sites on VGAM58 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM58 host target RNA into VGAM58 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[1624] It is appreciated that VGAM58 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM58 host target genes. The mRNA of each one of this plurality of VGAM58 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM58 RNA, herein designated VGAM RNA, and which when bound by VGAM58 RNA causes inhibition of translation of respective one or more VGAM58 host target proteins.

[1625] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM58 gene, herein designated VGAM GENE, on one or more VGAM58 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective:

Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[1626] It is yet further appreciated that a function of VGAM58 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM58 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM58 correlate with, and may be deduced from, the identity of the host target genes which VGAM58 binds and inhibits, and the function of these host target genes, as elaborated herein–below.

[1627] Nucleotide sequences of the VGAM58 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM58 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM58 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM58 are further described hereinbelow with reference to Table 1.

[1628] Nucleotide sequences of host target binding sites, such as BINDING SITE–I, BINDING SITE–II and BINDING SITE–III of Fig. 1, found on VGAM58 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM58 RNA, herein desig–

nated VGAM RNA, are described hereinbelow with reference to Table 2.

[1629] As mentioned hereinabove with reference to Fig. 1, a function of VGAM58 gene, herein designated VGAM is inhibition of expression of VGAM58 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM58 correlate with, and may be deduced from, the identity of the target genes which VGAM58 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[1630] Dopamine Receptor D1 (DRD1, Accession NM_000794) is a VGAM58 host target gene. DRD1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DRD1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DRD1 BINDING SITE, designated SEQ ID:774, to the nucleotide sequence of VGAM58 RNA, herein designated VGAM RNA, also designated SEQ ID:393.

[1631] A function of VGAM58 is therefore inhibition of Dopamine Receptor D1 (DRD1, Accession NM_000794), a gene which is mediated by g proteins which activate adenylyl cyclase.

Accordingly, utilities of VGAM58 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DRD1. The function of DRD1 has been established by previous studies. The diverse physiologic actions of dopamine are mediated by its interaction with 2 types of G protein-coupled receptor, D1 and D2 (OMIM Ref. No. 126450), which stimulate and inhibit, respectively, the enzyme adenylyl cyclase. Three groups reported the cloning of the D1 dopamine receptor gene (Dearry et al., 1990; Zhou et al., 1990; Sunahara et al., 1990). The gene encodes a protein of 446 amino acids having a predicted relative molecular mass of 49,300 and a trans-membrane topology similar to that of other G protein-coupled receptors. Northern blot analysis and in situ hybridization showed that the mRNA for this receptor is most abundant in caudate, nucleus accumbens, and olfactory tubercle, with little or no mRNA detectable in substantia nigra, liver, kidney, or heart (Dearry et al., 1990). Animal model experiments lend further support to the function of DRD1. The brain dopaminergic system is a critical modulator of basal ganglion function and plasticity. To investigate the contribution of the dopamine D1 receptor to this modulation, Xu et al. (1994) used gene

targeting technology to generate D1 receptor mutant mice. Although histologic analyses suggested no major changes in the anatomy of mutant mouse brains, the expression of dynorphin (OMIM Ref. No. 131340) was greatly reduced in the striatum and related regions of the basal ganglia. The mutant mice did not respond to the stimulant and suppressive effects of D1 receptor agonists and antagonists, respectively, and they exhibited locomotor hyperactivity.

[1632] It is appreciated that the abovementioned animal model for DRD1 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[1633] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[1634] Dearry, A.; Gingrich, J. A.; Falardeau, P.; Fremeau, R. T., Jr.; Bates, M. D.; Caron, M. G. : Molecular cloning and expression of the gene for a human D(1) dopamine receptor. Nature 347: 72-76, 1990. ; and

[1635] Xu, M.; Moratalla, R.; Gold, L. H.; Hiroi, N.; Koob, G. F.; Graybiel, A. M.; Tonegawa, S. : Dopamine D1 receptor mutant mice are deficient in striatal expression of dynor-

phin and in do.

[1636] Further studies establishing the function and utilities of DRD1 are found in John Hopkins OMIM database record ID 126449, and in cited publications numbered 2744–2755 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. KIAA0182 (Accession XM_050495) is another VGAM58 host target gene. KIAA0182 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0182, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0182 BINDING SITE, designated SEQ ID:2931, to the nucleotide sequence of VGAM58 RNA, herein designated VGAM RNA, also designated SEQ ID:393.

[1637] Another function of VGAM58 is therefore inhibition of KIAA0182 (Accession XM_050495). Accordingly, utilities of VGAM58 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0182. SSH2 (Accession XM_030846) is another VGAM58 host target gene. SSH2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region

of mRNA encoded by SSH2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SSH2 BINDING SITE, designated SEQ ID:2626, to the nucleotide sequence of VGAM58 RNA, herein designated VGAM RNA, also designated SEQ ID:393.

[1638] Another function of VGAM58 is therefore inhibition of SSH2 (Accession XM_030846). Accordingly, utilities of VGAM58 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SSH2. LOC90918 (Accession XM_034863) is another VGAM58 host target gene. LOC90918 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC90918, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90918 BINDING SITE, designated SEQ ID:2687, to the nucleotide sequence of VGAM58 RNA, herein designated VGAM RNA, also designated SEQ ID:393.

[1639] Another function of VGAM58 is therefore inhibition of LOC90918 (Accession XM_034863). Accordingly, utilities

of VGAM58 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90918. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 59 (VGAM59) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[1640] VGAM59 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM59 was detected is described hereinabove with reference to Figs. 1–8.

[1641] VGAM59 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus. VGAM59 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[1642] VGAM59 gene encodes a VGAM59 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM59 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM59 precursor RNA is designated SEQ

ID:45, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:45 is located at position 13536 relative to the genome of Vaccinia Virus.

[1643] VGAM59 precursor RNA folds onto itself, forming VGAM59 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[1644] An enzyme complex designated DICER COMPLEX, `dices` the VGAM59 folded precursor RNA into VGAM59 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 88%) nucleotide sequence of VGAM59 RNA is designated SEQ ID:394, and is provided hereinbelow with reference to the sequence list-

ing part.

[1645] VGAM59 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM59 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM59 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[1646] VGAM59 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM59 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM59 RNA is an accurate or a partial inverted-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM59 RNA, herein designated VGAM RNA, may have a different num-

ber of host target binding sites in untranslated regions of a VGAM59 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR and 5' UTR regions.

[1647] The complementary binding of VGAM59 RNA, herein designated VGAM RNA, to host target binding sites on VGAM59 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM59 host target RNA into VGAM59 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[1648] It is appreciated that VGAM59 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM59 host target genes. The mRNA of each one of this plurality of VGAM59 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM59 RNA, herein designated VGAM RNA, and which when bound by VGAM59 RNA causes in–

hibition of translation of respective one or more VGAM59 host target proteins.

[1649] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM59 gene, herein designated VGAM GENE, on one or more VGAM59 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[1650] It is yet further appreciated that a function of VGAM59 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM59 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific

functions, and accordingly utilities, of VGAM59 correlate with, and may be deduced from, the identity of the host target genes which VGAM59 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[1651] Nucleotide sequences of the VGAM59 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM59 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM59 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM59 are further described hereinbelow with reference to Table 1.

[1652] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM59 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM59 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[1653] As mentioned hereinabove with reference to Fig. 1, a function of VGAM59 gene, herein designated VGAM is inhibition of expression of VGAM59 target genes. It is appreciated that specific functions, and accordingly utilities,

of VGAM59 correlate with, and may be deduced from, the identity of the target genes which VGAM59 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[1654] Enoyl-Coenzyme A, Hydratase/3-hydroxyacyl Coenzyme A Dehydrogenase (EHHADH, Accession NM_001966) is a VGAM59 host target gene. EHHADH BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EHHADH, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EHHADH BINDING SITE, designated SEQ ID:877, to the nucleotide sequence of VGAM59 RNA, herein designated VGAM RNA, also designated SEQ ID:394.

[1655] A function of VGAM59 is therefore inhibition of Enoyl-Coenzyme A, Hydratase/3-hydroxyacyl Coenzyme A Dehydrogenase (EHHADH, Accession NM_001966), a gene which functions in the peroxisomal beta-oxidation pathway. Accordingly, utilities of VGAM59 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EHHADH. The function of EHHADH has been established by previous studies. Hoefler et al.

(1994) reported the full-length cDNA sequence of the enoyl-CoA-hydratase:3-hydroxyacyl-CoA dehydrogenase bifunctional enzyme. The cDNA sequence spans 3,779 nucleotides with an open reading frame of 2,169 nucleotides. Animal model experiments lend further support to the function of EHHADH. Qi et al. (1999) generated Lpb null mice. Mutant mice were viable and fertile and exhibited no detectable gross phenotypic defects. The only defect was a blunting of peroxisome proliferative response upon challenge with a peroxisome proliferator. The absence of appreciable changes in lipid metabolism indicated that enoyl-CoAs, generated in the classical system in Lpb null mice, were diverted to the D-hydroxy-specific system for metabolism by Dpb (OMIM Ref. No. 601860).

[1656] It is appreciated that the abovementioned animal model for EHHADH is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[1657] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[1658] Hoefler, G.; Forstner, M.; McGuinness, M. C.; Hulla, W.; Hiden, M.; Krisper, P.; Kenner, L.; Ried, T.; Lengauer, C.;

Zechner, R.; mOser, H. W.; Chen, G. L. : cDNA cloning of the human peroxisomal enoyl-CoA hydratase:3-hydroxyacyl-CoA dehydrogenase bifunctional enzyme and localization to chromosome 3q26.3-3q28: a free left Alu arm is inserted in the 3-prime noncoding region. Genomics 19: 60-67, 1994. ; and

[1659] Qi, C.; Zhu, Y.; Pan, J.; Usuda, N.; Maeda, N.; Yeldandi, A. V.; Rao, M. S.; Hashimoto, T.; Reddy, J. K. : Absence of spontaneous peroxisome proliferation in enoyl-CoA hydratase/L-3-hyd.

[1660] Further studies establishing the function and utilities of EHHADH are found in John Hopkins OMIM database record ID 607037, and in cited publications numbered 1185 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. A Disintegrin and Metalloproteinase Domain 9 (meltrin gamma) (ADAM9, Accession NM_003816) is another VGAM59 host target gene. ADAM9 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ADAM9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ADAM9 BINDING SITE, designated SEQ

ID:1063, to the nucleotide sequence of VGAM59 RNA, herein designated VGAM RNA, also designated SEQ ID:394.

[1661] Another function of VGAM59 is therefore inhibition of A Disintegrin and Metalloproteinase Domain 9 (meltrin gamma) (ADAM9, Accession NM_003816). Accordingly, utilities of VGAM59 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADAM9. Breast Cancer Anti-estrogen Resistance 3 (BCAR3, Accession NM_003567) is another VGAM59 host target gene. BCAR3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BCAR3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BCAR3 BINDING SITE, designated SEQ ID:1036, to the nucleotide sequence of VGAM59 RNA, herein designated VGAM RNA, also designated SEQ ID:394.

[1662] Another function of VGAM59 is therefore inhibition of Breast Cancer Anti-estrogen Resistance 3 (BCAR3, Accession NM_003567). Accordingly, utilities of VGAM59 include diagnosis, prevention and treatment of diseases and

clinical conditions associated with BCAR3. XAP135 (Accession NM_018288) is another VGAM59 host target gene. XAP135 BINDING SITE1 and XAP135 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by XAP135, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of XAP135 BINDING SITE1 and XAP135 BINDING SITE2, designated SEQ ID:1809 and SEQ ID:2408 respectively, to the nucleotide sequence of VGAM59 RNA, herein designated VGAM RNA, also designated SEQ ID:394.

[1663] Another function of VGAM59 is therefore inhibition of XAP135 (Accession NM_018288). Accordingly, utilities of VGAM59 include diagnosis, prevention and treatment of diseases and clinical conditions associated with XAP135. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 60 (VGAM60) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[1664] VGAM60 is a novel bioinformatically detected regulatory,

non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM60 was detected is described hereinabove with reference to Figs. 1–8.

[1665] VGAM60 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus. VGAM60 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[1666] VGAM60 gene encodes a VGAM60 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM60 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM60 precursor RNA is designated SEQ ID:46, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:46 is located at position 9389 relative to the genome of Vaccinia Virus.

[1667] VGAM60 precursor RNA folds onto itself, forming VGAM60 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first

half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[1668] An enzyme complex designated DICER COMPLEX, `dices` the VGAM60 folded precursor RNA into VGAM60 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 70%) nucleotide sequence of VGAM60 RNA is designated SEQ ID:395, and is provided hereinbelow with reference to the sequence listing part.

[1669] VGAM60 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM60 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM60 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[1670] VGAM60 RNA, herein designated VGAM RNA, binds com-

plementarily to one or more host target binding sites located in untranslated regions of VGAM60 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM60 RNA is an accurate or a partial inverted-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM60 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM60 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[1671] The complementary binding of VGAM60 RNA, herein designated VGAM RNA, to host target binding sites on VGAM60 host target RNA, herein designated VGAM HOST

TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM60 host target RNA into VGAM60 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[1672] It is appreciated that VGAM60 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM60 host target genes. The mRNA of each one of this plurality of VGAM60 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM60 RNA, herein designated VGAM RNA, and which when bound by VGAM60 RNA causes inhibition of translation of respective one or more VGAM60 host target proteins.

[1673] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM60 gene, herein designated VGAM GENE, on one or more VGAM60 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific

complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[1674] It is yet further appreciated that a function of VGAM60 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM60 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM60 correlate with, and may be deduced from, the identity of the host target genes which VGAM60 binds and inhibits, and the function of these host target genes, as elaborated herein-below.

[1675] Nucleotide sequences of the VGAM60 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM60 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM60 folded precursor RNA, herein designated VGAM

FOLDED PRECURSOR RNA, of VGAM60 are further described hereinbelow with reference to Table 1.

[1676] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM60 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM60 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[1677] As mentioned hereinabove with reference to Fig. 1, a function of VGAM60 gene, herein designated VGAM is inhibition of expression of VGAM60 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM60 correlate with, and may be deduced from, the identity of the target genes which VGAM60 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[1678] MGC5242 (Accession NM_024033) is a VGAM60 host target gene. MGC5242 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MGC5242, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of MGC5242 BINDING SITE, designated SEQ ID:2042, to the nucleotide sequence of VGAM60 RNA, herein designated VGAM RNA, also designated SEQ ID:395.

[1679] A function of VGAM60 is therefore inhibition of MGC5242 (Accession NM_024033). Accordingly, utilities of VGAM60 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC5242.

LOC197259 (Accession XM_113849) is another VGAM60 host target gene. LOC197259 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC197259, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC197259 BINDING SITE, designated SEQ ID:3422, to the nucleotide sequence of VGAM60 RNA, herein designated VGAM RNA, also designated SEQ ID:395.

[1680] Another function of VGAM60 is therefore inhibition of LOC197259 (Accession XM_113849). Accordingly, utilities of VGAM60 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC197259. Fig. 1 further provides a conceptual descrip-

tion of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 61 (VGAM61) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[1681] VGAM61 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM61 was detected is described hereinabove with reference to Figs. 1–8.

[1682] VGAM61 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus. VGAM61 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[1683] VGAM61 gene encodes a VGAM61 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM61 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM61 precursor RNA is designated SEQ ID:47, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:47 is located at position 8516 relative to the genome of Vac–

cinia Virus.

[1684] VGAM61 precursor RNA folds onto itself, forming VGAM61 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[1685] An enzyme complex designated DICER COMPLEX, `dices` the VGAM61 folded precursor RNA into VGAM61 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 73%) nucleotide sequence of VGAM61 RNA is designated SEQ ID:396, and is provided hereinbelow with reference to the sequence listing part.

[1686] VGAM61 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA,

VGAM61 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM61 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[1687] VGAM61 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM61 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM61 RNA is an accurate or a partial inverted-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM61 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM61 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig.

1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[1688] The complementary binding of VGAM61 RNA, herein designated VGAM RNA, to host target binding sites on VGAM61 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM61 host target RNA into VGAM61 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[1689] It is appreciated that VGAM61 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM61 host target genes. The mRNA of each one of this plurality of VGAM61 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM61 RNA, herein designated VGAM RNA, and which when bound by VGAM61 RNA causes inhibition of translation of respective one or more VGAM61 host target proteins.

[1690] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM61 gene, herein designated VGAM GENE, on one or more VGAM61 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[1691] It is yet further appreciated that a function of VGAM61 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM61 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM61 correlate with, and may be deduced from, the identity of the host target genes which VGAM61 binds and inhibits, and the

function of these host target genes, as elaborated herein—below.

[1692] Nucleotide sequences of the VGAM61 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM61 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM61 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM61 are further described hereinbelow with reference to Table 1.

[1693] Nucleotide sequences of host target binding sites, such as BINDING SITE–I, BINDING SITE–II and BINDING SITE–III of Fig. 1, found on VGAM61 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM61 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[1694] As mentioned hereinabove with reference to Fig. 1, a function of VGAM61 gene, herein designated VGAM is inhibition of expression of VGAM61 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM61 correlate with, and may be deduced from, the identity of the target genes which VGAM61 binds and inhibits, and the function of these target genes, as elabo—

rated hereinbelow.

[1695] DKFZP564I052 (Accession XM_039660) is a VGAM61 host target gene. DKFZP564I052 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP564I052, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP564I052 BINDING SITE, designated SEQ ID:2759, to the nucleotide sequence of VGAM61 RNA, herein designated VGAM RNA, also designated SEQ ID:396.

[1696] A function of VGAM61 is therefore inhibition of DKFZP564I052 (Accession XM_039660). Accordingly, utilities of VGAM61 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP564I052. KIAA0825 (Accession XM_027906) is another VGAM61 host target gene. KIAA0825 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0825, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0825 BINDING SITE, designated SEQ ID:2588, to the

nucleotide sequence of VGAM61 RNA, herein designated VGAM RNA, also designated SEQ ID:396.

[1697] Another function of VGAM61 is therefore inhibition of KIAA0825 (Accession XM_027906). Accordingly, utilities of VGAM61 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0825. KIAA0976 (Accession NM_014917) is another VGAM61 host target gene. KIAA0976 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0976, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0976 BINDING SITE, designated SEQ ID:1588, to the nucleotide sequence of VGAM61 RNA, herein designated VGAM RNA, also designated SEQ ID:396.

[1698] Another function of VGAM61 is therefore inhibition of KIAA0976 (Accession NM_014917). Accordingly, utilities of VGAM61 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0976. Placenta-specific 3 (PLAC3, Accession XM_045115) is another VGAM61 host target gene. PLAC3 BINDING SITE is HOST TARGET binding site found in the

3` untranslated region of mRNA encoded by PLAC3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PLAC3 BINDING SITE, designated SEQ ID:2853, to the nucleotide sequence of VGAM61 RNA, herein designated VGAM RNA, also designated SEQ ID:396.

[1699] Another function of VGAM61 is therefore inhibition of Placenta-specific 3 (PLAC3, Accession XM_045115). Accordingly, utilities of VGAM61 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PLAC3. LOC147991 (Accession XM_085993) is another VGAM61 host target gene. LOC147991 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC147991, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147991 BINDING SITE, designated SEQ ID:3115, to the nucleotide sequence of VGAM61 RNA, herein designated VGAM RNA, also designated SEQ ID:396.

[1700] Another function of VGAM61 is therefore inhibition of LOC147991 (Accession XM_085993). Accordingly, utilities

of VGAM61 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147991. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 62 (VGAM62) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[1701] VGAM62 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM62 was detected is described hereinabove with reference to Figs. 1–8.

[1702] VGAM62 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus. VGAM62 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[1703] VGAM62 gene encodes a VGAM62 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM62 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM62 precursor RNA is designated SEQ

ID:48, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:48 is located at position 10036 relative to the genome of Vaccinia Virus.

[1704] VGAM62 precursor RNA folds onto itself, forming VGAM62 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[1705] An enzyme complex designated DICER COMPLEX, `dices` the VGAM62 folded precursor RNA into VGAM62 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of VGAM62 RNA is designated SEQ ID:397, and is provided hereinbelow with reference to the sequence list-

ing part.

[1706] VGAM62 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM62 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM62 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[1707] VGAM62 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM62 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM62 RNA is an accurate or a partial inverted-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM62 RNA, herein designated VGAM RNA, may have a different num-

ber of host target binding sites in untranslated regions of a VGAM62 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR and 5' UTR regions.

[1708] The complementary binding of VGAM62 RNA, herein designated VGAM RNA, to host target binding sites on VGAM62 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM62 host target RNA into VGAM62 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[1709] It is appreciated that VGAM62 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM62 host target genes. The mRNA of each one of this plurality of VGAM62 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM62 RNA, herein designated VGAM RNA, and which when bound by VGAM62 RNA causes in–

hibition of translation of respective one or more VGAM62 host target proteins.

[1710] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM62 gene, herein designated VGAM GENE, on one or more VGAM62 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[1711] It is yet further appreciated that a function of VGAM62 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM62 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific

functions, and accordingly utilities, of VGAM62 correlate with, and may be deduced from, the identity of the host target genes which VGAM62 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[1712] Nucleotide sequences of the VGAM62 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM62 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM62 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM62 are further described hereinbelow with reference to Table 1.

[1713] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM62 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM62 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[1714] As mentioned hereinabove with reference to Fig. 1, a function of VGAM62 gene, herein designated VGAM is inhibition of expression of VGAM62 target genes. It is appreciated that specific functions, and accordingly utilities,

of VGAM62 correlate with, and may be deduced from, the identity of the target genes which VGAM62 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[1715] Histone Deacetylase 7A (HDAC7A, Accession NM_015401) is a VGAM62 host target gene. HDAC7A BINDING SITE1 and HDAC7A BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by HDAC7A, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HDAC7A BINDING SITE1 and HDAC7A BINDING SITE2, designated SEQ ID:1628 and SEQ ID:1700 respectively, to the nucleotide sequence of VGAM62 RNA, herein designated VGAM RNA, also designated SEQ ID:397.

[1716] A function of VGAM62 is therefore inhibition of Histone Deacetylase 7A (HDAC7A, Accession NM_015401). Accordingly, utilities of VGAM62 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HDAC7A. Platelet-derived Growth Factor Beta Polypeptide (simian sarcoma viral (v-sis) Oncogene Homolog) (PDGFB, Accession NM_002608) is another

VGAM62 host target gene. PDGFB BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PDGFB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PDGFB BINDING SITE, designated SEQ ID:941, to the nucleotide sequence of VGAM62 RNA, herein designated VGAM RNA, also designated SEQ ID:397.

[1717] Another function of VGAM62 is therefore inhibition of Platelet-derived Growth Factor Beta Polypeptide (simian sarcoma viral (v-sis) Oncogene Homolog) (PDGFB, Accession NM_002608), a gene which plays an important role in stimulating adjacent cells to grow and thereby heal the wound. Accordingly, utilities of VGAM62 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PDGFB. The function of PDGFB has been established by previous studies. Most proliferating cells are programmed to undergo apoptosis unless specific survival signals are provided. Platelet-derived growth factor promotes cellular proliferation and inhibits apoptosis. Romashkova and Makarov (1999) showed that PDGF activates the RAS/PIK3/AKT1/IKK/NFKB1 pathway. In this

pathway, NFKB1 (OMIM Ref. No. 164011) does not induce c-myc and apoptosis, but instead induces putative anti-apoptotic genes. In response to PDGF, AKT1 (OMIM Ref. No. 164730) transiently associates with IKK (see OMIM Ref. No. 600664) and induces IKK activation. The authors suggested that under certain conditions PIK3 (see OMIM Ref. No. 171834) may activate NFKB1 without the involvement of NFKBIA (OMIM Ref. No. 164008) or NFKBIB (OMIM Ref. No. 604495) degradation. Dermatofibrosarcoma protuberans (DFSP), an infiltrative skin tumor of intermediate malignancy, presents specific cytogenetic features such as reciprocal translocations t(17;22)(q22;q13) and supernumerary ring chromosomes derived from t(17;22). Simon et al. (1997) characterized the breakpoints from translocations and rings in dermatofibrosarcoma protuberans and its juvenile form, giant cell fibroblastoma, on the genomic and RNA levels. They found that these rearrangements fuse the PDGFB gene and the COL1A1 gene (OMIM Ref. No. 120150). Simon et al. (1997) commented that PDGFB has transforming activity and is a potent mitogen for a number of cell types, but its role in oncogenic processes was not fully understood. They noted that neither COL1A1 nor PDGFB had hitherto been implicated in tumor translo-

cations. The gene fusions deleted exon 1 of PDGFB and released this growth factor from its normal regulation; see 190040.0002.

- [1718] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:
- [1719] Simon, M.-P.; Pedeutour, F.; Sirvent, N.; Grosgeorge, J.; Minoletti, F.; Coindre, J.-M.; Terrier-Lacombe, M.-J.; Mandahl, N.; Craver, R. D.; Blin, N.; Sozzi, G.; Turc-Carel, C.; O'Brien, K. P.; Kedra, D.; Fransson, I.; Guilbaud, C.; Dumanski, J. P. : Deregulation of the platelet-derived growth factor B-chain gene via fusion with collagen gene COL1A1 in dermatofibrosarcoma protuberans and giant-cell fibroblastoma. *Nature Genet.* 15: 95-98, 1997. ; and
- [1720] Josephs, S. F.; Guo, C.; Ratner, L.; Wong-Staal, F. : Human proto-oncogene nucleotide sequences corresponding to the transforming region of simian sarcoma virus. *Science* 223: 487-491, 1.
- [1721] Further studies establishing the function and utilities of PDGFB are found in John Hopkins OMIM database record ID 190040, and in cited publications numbered 2377-2387, 2187-2190, 2286-2193, 755-757, 2194-2196, 832, 2197-2201, 3059, 2207, 2660, 220

and 2376 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. PR Domain Containing 4 (PRDM4, Accession NM_012406) is another VGAM62 host target gene. PRDM4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PRDM4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRDM4 BINDING SITE, designated SEQ ID:1427, to the nucleotide sequence of VGAM62 RNA, herein designated VGAM RNA, also designated SEQ ID:397.

[1722] Another function of VGAM62 is therefore inhibition of PR Domain Containing 4 (PRDM4, Accession NM_012406). Accordingly, utilities of VGAM62 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRDM4. Sirtuin Silent Mating Type Information Regulation 2 Homolog 6 (*S. cerevisiae*) (SIRT6, Accession NM_016539) is another VGAM62 host target gene. SIRT6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SIRT6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2

illustrates the complementarity of the nucleotide sequences of SIRT6 BINDING SITE, designated SEQ ID:1695, to the nucleotide sequence of VGAM62 RNA, herein designated VGAM RNA, also designated SEQ ID:397.

[1723] Another function of VGAM62 is therefore inhibition of Sir-tuin Silent Mating Type Information Regulation 2 Homolog 6 (*S. cerevisiae*) (SIRT6, Accession NM_016539). Accordingly, utilities of VGAM62 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SIRT6. Xylulokinase Homolog (*H. influenzae*) (XYLB, Accession NM_005108) is another VGAM62 host target gene. XYLB BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by XYLB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of XYLB BINDING SITE, designated SEQ ID:1187, to the nucleotide sequence of VGAM62 RNA, herein designated VGAM RNA, also designated SEQ ID:397.

[1724] Another function of VGAM62 is therefore inhibition of Xylulokinase Homolog (*H. influenzae*) (XYLB, Accession NM_005108), a gene which is similar to *Haemophilus influenzae* xylulokinase and may play a role in energy

metabolism. Accordingly, utilities of VGAM62 include diagnosis, prevention and treatment of diseases and clinical conditions associated with XYLB. The function of XYLB has been established by previous studies. The 3p22–p21.3 chromosomal region is one of 3 regions of 3p that is commonly deleted in various carcinomas. By analysis of a cloned segment from this region, Tamari et al. (1998) identified a novel gene, which they designated XYLB because the predicted 528–amino acid protein shares 22% identity with *Hemophilus influenzae* xylulokinase (Xyl). The XYLB gene contains 18 exons and spans approximately 28 kb. Northern blot analysis revealed that XYLB was expressed as a 2.3–kb major transcript in all tissues tested. A less abundant 1.8–kb mRNA was detected in heart and skeletal muscle. Daigo et al. (1999) reported that the XYLB gene is located between the OCTL2 (OMIM Ref. No. 604048) and ActRIIB (OMIM Ref. No. 602730) genes on 3p22–p21.3.

[1725] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[1726] Daigo, Y.; Isomura, M.; Nishiwaki, T.; Tamari, M.; Ishikawa, S.; Kai, M.; Murata, Y.; Takeuchi, K.; Yamane, Y.;

[1727] Tamari, M.; Daigo, Y.; Ishikawa, S.; Nakamura, Y. : Genomic structure of a novel human gene (XYLB) on chromosome 3p22-p21.3 encoding a xylulokinase-like protein. Cytogenet. Cell Genet.

[1728] Further studies establishing the function and utilities of XYLB are found in John Hopkins OMIM database record ID 604049, and in cited publications numbered 2027 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. DKFZP434N093 (Accession XM_086948) is another VGAM62 host target gene. DKFZP434N093 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP434N093, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434N093 BINDING SITE, designated SEQ ID:3147, to the nucleotide sequence of VGAM62 RNA, herein designated VGAM RNA, also designated SEQ ID:397.

[1729] Another function of VGAM62 is therefore inhibition of DKFZP434N093 (Accession XM_086948). Accordingly, utilities of VGAM62 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434N093. DKFZP547E1010 (Accession XM_040002) is another VGAM62 host target gene. DKFZP547E1010 BINDING SITE1 and DKFZP547E1010 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by DKFZP547E1010, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP547E1010 BINDING SITE1 and DKFZP547E1010 BINDING SITE2, designated SEQ ID:2768 and SEQ ID:1640 respectively, to the nucleotide sequence of VGAM62 RNA, herein designated VGAM RNA, also designated SEQ ID:397.

[1730] Another function of VGAM62 is therefore inhibition of DKFZP547E1010 (Accession XM_040002). Accordingly, utilities of VGAM62 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP547E1010. FLJ14596 (Accession NM_032809) is another VGAM62 host target gene. FLJ14596 BINDING SITE is

HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ14596, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14596 BINDING SITE, designated SEQ ID:2282, to the nucleotide sequence of VGAM62 RNA, herein designated VGAM RNA, also designated SEQ ID:397.

[1731] Another function of VGAM62 is therefore inhibition of FLJ14596 (Accession NM_032809). Accordingly, utilities of VGAM62 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14596. HRLP5 (Accession NM_054108) is another VGAM62 host target gene. HRLP5 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HRLP5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HRLP5 BINDING SITE, designated SEQ ID:2364, to the nucleotide sequence of VGAM62 RNA, herein designated VGAM RNA, also designated SEQ ID:397.

[1732] Another function of VGAM62 is therefore inhibition of

HRLP5 (Accession NM_054108). Accordingly, utilities of VGAM62 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HRLP5. Potassium Voltage-gated Channel, Delayed-rectifier, Subfamily S, Member 1 (KCNS1, Accession NM_002251) is another VGAM62 host target gene. KCNS1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KCNS1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KCNS1 BINDING SITE, designated SEQ ID:917, to the nucleotide sequence of VGAM62 RNA, herein designated VGAM RNA, also designated SEQ ID:397.

[1733] Another function of VGAM62 is therefore inhibition of Potassium Voltage-gated Channel, Delayed-rectifier, Subfamily S, Member 1 (KCNS1, Accession NM_002251). Accordingly, utilities of VGAM62 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KCNS1. KIAA0992 (Accession NM_016081) is another VGAM62 host target gene. KIAA0992 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA0992, corre-

sponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0992 BINDING SITE, designated SEQ ID:1662, to the nucleotide sequence of VGAM62 RNA, herein designated VGAM RNA, also designated SEQ ID:397.

[1734] Another function of VGAM62 is therefore inhibition of KIAA0992 (Accession NM_016081). Accordingly, utilities of VGAM62 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0992. KIAA1975 (Accession XM_058393) is another VGAM62 host target gene. KIAA1975 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1975, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1975 BINDING SITE, designated SEQ ID:2982, to the nucleotide sequence of VGAM62 RNA, herein designated VGAM RNA, also designated SEQ ID:397.

[1735] Another function of VGAM62 is therefore inhibition of KIAA1975 (Accession XM_058393). Accordingly, utilities of VGAM62 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with KIAA1975. MGC5590 (Accession NM_024058) is another VGAM62 host target gene. MGC5590 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC5590, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC5590 BINDING SITE, designated SEQ ID:2049, to the nucleotide sequence of VGAM62 RNA, herein designated VGAM RNA, also designated SEQ ID:397.

[1736] Another function of VGAM62 is therefore inhibition of MGC5590 (Accession NM_024058). Accordingly, utilities of VGAM62 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC5590. Sialyltransferase 8C (alpha2,3Galbeta1,4GlcNAcalpha 2,8-sialyltransferase) (SIAT8C, Accession NM_015879) is another VGAM62 host target gene. SIAT8C BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by SIAT8C, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the

nucleotide sequences of SIAT8C BINDING SITE, designated SEQ ID:1648, to the nucleotide sequence of VGAM62 RNA, herein designated VGAM RNA, also designated SEQ ID:397.

[1737] Another function of VGAM62 is therefore inhibition of Sialyltransferase 8C (alpha2,3Galbeta1,4GlcNAcalpha 2,8-sialyltransferase) (SIAT8C, Accession NM_015879). Accordingly, utilities of VGAM62 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SIAT8C. LOC149706 (Accession XM_097718) is another VGAM62 host target gene. LOC149706 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC149706, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149706 BINDING SITE, designated SEQ ID:3313, to the nucleotide sequence of VGAM62 RNA, herein designated VGAM RNA, also designated SEQ ID:397.

[1738] Another function of VGAM62 is therefore inhibition of LOC149706 (Accession XM_097718). Accordingly, utilities of VGAM62 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LOC149706. LOC160292 (Accession XM_100817) is another VGAM62 host target gene. LOC160292 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC160292, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC160292 BINDING SITE, designated SEQ ID:3399, to the nucleotide sequence of VGAM62 RNA, herein designated VGAM RNA, also designated SEQ ID:397.

[1739] Another function of VGAM62 is therefore inhibition of LOC160292 (Accession XM_100817). Accordingly, utilities of VGAM62 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC160292. LOC203378 (Accession XM_117541) is another VGAM62 host target gene. LOC203378 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC203378, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC203378 BINDING SITE, designated SEQ ID:3491, to

the nucleotide sequence of VGAM62 RNA, herein designated VGAM RNA, also designated SEQ ID:397.

[1740] Another function of VGAM62 is therefore inhibition of LOC203378 (Accession XM_117541). Accordingly, utilities of VGAM62 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC203378. LOC204200 (Accession XM_118520) is another VGAM62 host target gene. LOC204200 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC204200, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC204200 BINDING SITE, designated SEQ ID:3493, to the nucleotide sequence of VGAM62 RNA, herein designated VGAM RNA, also designated SEQ ID:397.

[1741] Another function of VGAM62 is therefore inhibition of LOC204200 (Accession XM_118520). Accordingly, utilities of VGAM62 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC204200. LOC255265 (Accession XM_170902) is another VGAM62 host target gene. LOC255265 BINDING SITE is HOST TARGET binding site found in the 5' un-

translated region of mRNA encoded by LOC255265, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255265 BINDING SITE, designated SEQ ID:3672, to the nucleotide sequence of VGAM62 RNA, herein designated VGAM RNA, also designated SEQ ID:397.

[1742] Another function of VGAM62 is therefore inhibition of LOC255265 (Accession XM_170902). Accordingly, utilities of VGAM62 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255265. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 63 (VGAM63) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[1743] VGAM63 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM63 was detected is described hereinabove with reference to Figs. 1–8.

[1744] VGAM63 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Vaccinia Virus. VGAM63 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[1745] VGAM63 gene encodes a VGAM63 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM63 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM63 precursor RNA is designated SEQ ID:49, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:49 is located at position 14074 relative to the genome of Vaccinia Virus.

[1746] VGAM63 precursor RNA folds onto itself, forming VGAM63 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[1747] An enzyme complex designated DICER COMPLEX, `dices`

the VGAM63 folded precursor RNA into VGAM63 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 71%) nucleotide sequence of VGAM63 RNA is designated SEQ ID:398, and is provided hereinbelow with reference to the sequence listing part.

[1748] VGAM63 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM63 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM63 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[1749] VGAM63 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM63 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide

sequence of VGAM63 RNA is an accurate or a partial inverted-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM63 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM63 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR and 5' UTR regions.

[1750] The complementary binding of VGAM63 RNA, herein designated VGAM RNA, to host target binding sites on VGAM63 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM63 host target RNA into VGAM63 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target

protein is therefore outlined by a broken line.

[1751] It is appreciated that VGAM63 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM63 host target genes. The mRNA of each one of this plurality of VGAM63 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM63 RNA, herein designated VGAM RNA, and which when bound by VGAM63 RNA causes inhibition of translation of respective one or more VGAM63 host target proteins.

[1752] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM63 gene, herein designated VGAM GENE, on one or more VGAM63 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression

of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[1753] It is yet further appreciated that a function of VGAM63 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM63 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM63 correlate with, and may be deduced from, the identity of the host target genes which VGAM63 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[1754] Nucleotide sequences of the VGAM63 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM63 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM63 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM63 are further described hereinbelow with reference to Table 1.

[1755] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on VGAM63 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM63 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[1756] As mentioned hereinabove with reference to Fig. 1, a function of VGAM63 gene, herein designated VGAM is inhibition of expression of VGAM63 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM63 correlate with, and may be deduced from, the identity of the target genes which VGAM63 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[1757] FLJ10737 (Accession NM_018198) is a VGAM63 host target gene. FLJ10737 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10737, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10737 BINDING SITE, designated SEQ ID:1797, to the nucleotide sequence of VGAM63 RNA, herein designated VGAM RNA, also designated SEQ ID:398.

[1758] A function of VGAM63 is therefore inhibition of FLJ10737 (Accession NM_018198). Accordingly, utilities of VGAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10737. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 64 (VGAM64) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[1759] VGAM64 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM64 was detected is described hereinabove with reference to Figs. 1–8.

[1760] VGAM64 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus. VGAM64 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[1761] VGAM64 gene encodes a VGAM64 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM64 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide se–

quence of VGAM64 precursor RNA is designated SEQ ID:50, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:50 is located at position 9005 relative to the genome of Vaccinia Virus.

[1762] VGAM64 precursor RNA folds onto itself, forming VGAM64 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[1763] An enzyme complex designated DICER COMPLEX, `dices` the VGAM64 folded precursor RNA into VGAM64 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 70%) nucleotide sequence of VGAM64 RNA is designated SEQ ID:399, and is

provided hereinbelow with reference to the sequence listing part.

[1764] VGAM64 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM64 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM64 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[1765] VGAM64 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM64 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM64 RNA is an accurate or a partial inverted-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM64 RNA,

herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM64 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR and 5' UTR regions.

[1766] The complementary binding of VGAM64 RNA, herein designated VGAM RNA, to host target binding sites on VGAM64 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM64 host target RNA into VGAM64 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[1767] It is appreciated that VGAM64 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM64 host target genes. The mRNA of each one of this plurality of VGAM64 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM64 RNA, herein designated VGAM

RNA, and which when bound by VGAM64 RNA causes inhibition of translation of respective one or more VGAM64 host target proteins.

[1768] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM64 gene, herein designated VGAM GENE, on one or more VGAM64 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[1769] It is yet further appreciated that a function of VGAM64 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM64 include diagnosis, prevention and

treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM64 correlate with, and may be deduced from, the identity of the host target genes which VGAM64 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[1770] Nucleotide sequences of the VGAM64 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM64 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM64 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM64 are further described hereinbelow with reference to Table 1.

[1771] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM64 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM64 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[1772] As mentioned hereinabove with reference to Fig. 1, a function of VGAM64 gene, herein designated VGAM is inhibition of expression of VGAM64 target genes. It is ap-

preciated that specific functions, and accordingly utilities, of VGAM64 correlate with, and may be deduced from, the identity of the target genes which VGAM64 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[1773] COX15 Homolog, Cytochrome C Oxidase Assembly Protein (yeast) (COX15, Accession NM_004376) is a VGAM64 host target gene. COX15 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by COX15, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of COX15 BINDING SITE, designated SEQ ID:1104, to the nucleotide sequence of VGAM64 RNA, herein designated VGAM RNA, also designated SEQ ID:399.

[1774] A function of VGAM64 is therefore inhibition of COX15 Homolog, Cytochrome C Oxidase Assembly Protein (yeast) (COX15, Accession NM_004376). Accordingly, utilities of VGAM64 include diagnosis, prevention and treatment of diseases and clinical conditions associated with COX15. SH2 Domain Protein 1A, Duncan's Disease (lymphoproliferative syndrome) (SH2D1A, Accession

NM_002351) is another VGAM64 host target gene.

SH2D1A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SH2D1A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SH2D1A BINDING SITE, designated SEQ ID:920, to the nucleotide sequence of VGAM64 RNA, herein designated VGAM RNA, also designated SEQ ID:399.

[1775] Another function of VGAM64 is therefore inhibition of SH2 Domain Protein 1A, Duncan's Disease (lymphoproliferative syndrome) (SH2D1A, Accession NM_002351), a gene which is involved in t cell signaling. inhibits slam self-association. Accordingly, utilities of VGAM64 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SH2D1A. The function of SH2D1A has been established by previous studies. Sumegi et al. (2000) reported that analysis of 35 families from the XLP Registry revealed 28 different mutations in 34 families: 3 large genomic deletions, 10 small intragenic deletions, 3 splice site, 3 nonsense, and 9 missense mutations. No mutations were found in 25 males, so-called

sporadic XLP (males with an XLP phenotype after EBV infection but no family history of XLP), or in 9 patients with chronic active EBV syndrome. The authors found that although EBV infection often resulted in fulminant infectious mononucleosis, it was not necessary for the expression of other manifestations of XLP and correlated poorly with outcome. They interpreted the results as suggesting that unidentified factors, either environmental or genetic (e.g., modifier genes), contribute to the pathogenesis of XLP. Animal model experiments lend further support to the function of SH2D1A. Wu et al. (2001) generated Sap-deficient mice, which were fertile and had no defects in lymphocyte surface markers or overall morphology. Sap-deficient mice had increased lymphocytic choriomeningitis virus (LCMV)-specific splenic and hepatic T cells and increased gamma-interferon (IFNG; 147570) production compared with their wildtype littermates. All Sap-deficient mice died as a result of hepatotropic LCMV infection, while only 30% of wildtype mice died. In contrast to the increased Ifng production, interleukin-4 (IL4; 147780) production was markedly lower in Sap-deficient mice. Mice with a BALB/c background are normally highly susceptible to infection with the *Leishmania major* parasite

due to poor Ifng production. However, Sap-deficient mice with a BALB/c background produced little Il4 and high levels of Ifng and had lower parasite burdens than wildtype BALB/c mice. This suggested that in the absence of SAP, IL4 gene activation is defective. Lower Il4 expression in Sap-deficient mice correlated with greatly reduced IgE production and reduced basal IgE expression. Wu et al. (2001) proposed that the Sap-deficient mouse model would be a useful tool for dissecting the complex XLP phenotypes.

[1776] It is appreciated that the abovementioned animal model for SH2D1A is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[1777] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[1778] Sumegi, J.; Huang, D.; Lanyi, A.; Davis, J. D.; Seemayer, T. A.; Maeda, A.; Klein, G.; Seri, M.; Wakiguchi, H.; Purtilo, D. T.; Gross, T. G. : Correlation of mutations of the SH2D1A gene and Epstein-Barr virus infection with clinical phenotype and outcome in X-linked lymphoproliferative disease. Blood 96: 3118-3125, 2000. ; and

- [1779] Wu, C.; Nguyen, K. B.; Pien, G. C.; Wang, N.; Gullo, C.; Duncan, H.; Sosa, M. R.; Edwards, M. J.; Borrow, P.; Satoskar, A. R.; Sharpe, A. H.; Biron, C. A.; Terhorst, C. : SAP controls T c.
- [1780] Further studies establishing the function and utilities of SH2D1A are found in John Hopkins OMIM database record ID 308240, and in cited publications numbered 1942–1945, 1947, 1948–1960, 942, 1827–1842, 2135–1850, 1978–30 and 1979–1989 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. FLJ12994 (Accession NM_022841) is another VGAM64 host target gene. FLJ12994 BINDING SITE1 and FLJ12994 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by FLJ12994, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12994 BINDING SITE1 and FLJ12994 BINDING SITE2, designated SEQ ID:2017 and SEQ ID:3081 respectively, to the nucleotide sequence of VGAM64 RNA, herein designated VGAM RNA, also designated SEQ ID:399.
- [1781] Another function of VGAM64 is therefore inhibition of

FLJ12994 (Accession NM_022841). Accordingly, utilities of VGAM64 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12994. Fibroblast Growth Factor Receptor 2 (bacteria-expressed kinase, keratinocyte growth factor receptor, craniofacial dysostosis 1, Crouzon syndrome, Pfeiffer syndrome, Jackson-Weiss syndrome) (FGFR2, Accession NM_022969) is another VGAM65 host target gene. FGFR2 BINDING SITE1 through FGFR2 BINDING SITE6 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by FGFR2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FGFR2 BINDING SITE1 through FGFR2 BINDING SITE6, designated SEQ ID:2023, SEQ ID:2024, SEQ ID:2026, SEQ ID:2027, SEQ ID:2028 and SEQ ID:2010 respectively, to the nucleotide sequence of VGAM65 RNA, herein designated VGAM RNA, also designated SEQ ID:400.

[1782] Another function of VGAM65 is therefore inhibition of Fibroblast Growth Factor Receptor 2 (bacteria-expressed kinase, keratinocyte growth factor receptor, craniofacial dysostosis 1, Crouzon syndrome, Pfeiffer syndrome, Jack-

son-Weiss syndrome) (FGFR2, Accession NM_022969). Accordingly, utilities of VGAM65 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FGFR2. OS4 (Accession NM_005730) is another VGAM66 host target gene. OS4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by OS4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OS4 BINDING SITE, designated SEQ ID:1239, to the nucleotide sequence of VGAM66 RNA, herein designated VGAM RNA, also designated SEQ ID:401.

[1783] Another function of VGAM66 is therefore inhibition of OS4 (Accession NM_005730). Accordingly, utilities of VGAM66 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OS4. LOC148289 (Accession XM_097437) is another VGAM66 host target gene. LOC148289 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC148289, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nu-

cleotide sequences of LOC148289 BINDING SITE, designated SEQ ID:3300, to the nucleotide sequence of VGAM66 RNA, herein designated VGAM RNA, also designated SEQ ID:401.

[1784] Another function of VGAM66 is therefore inhibition of LOC148289 (Accession XM_097437). Accordingly, utilities of VGAM66 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148289. LOC253160 (Accession XM_173016) is another VGAM66 host target gene. LOC253160 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC253160, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253160 BINDING SITE, designated SEQ ID:3714, to the nucleotide sequence of VGAM66 RNA, herein designated VGAM RNA, also designated SEQ ID:401.

[1785] Another function of VGAM66 is therefore inhibition of LOC253160 (Accession XM_173016). Accordingly, utilities of VGAM66 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253160. Fig. 1 further provides a conceptual descrip-

tion of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 67 (VGAM67) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[1786] VGAM67 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM67 was detected is described hereinabove with reference to Figs. 1–8.

[1787] VGAM67 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus. VGAM67 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[1788] VGAM67 gene encodes a VGAM67 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM67 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM67 precursor RNA is designated SEQ ID:53, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:53 is located at position 12981 relative to the genome of Vac–

cinia Virus.

[1789] VGAM67 precursor RNA folds onto itself, forming VGAM67 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[1790] An enzyme complex designated DICER COMPLEX, `dices` the VGAM67 folded precursor RNA into VGAM67 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 73%) nucleotide sequence of VGAM67 RNA is designated SEQ ID:402, and is provided hereinbelow with reference to the sequence listing part.

[1791] VGAM67 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA,

VGAM67 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM67 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[1792] VGAM67 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM67 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM67 RNA is an accurate or a partial inverted-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM67 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM67 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig.

1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[1793] The complementary binding of VGAM67 RNA, herein designated VGAM RNA, to host target binding sites on VGAM67 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM67 host target RNA into VGAM67 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[1794] It is appreciated that VGAM67 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM67 host target genes. The mRNA of each one of this plurality of VGAM67 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM67 RNA, herein designated VGAM RNA, and which when bound by VGAM67 RNA causes inhibition of translation of respective one or more VGAM67 host target proteins.

[1795] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM67 gene, herein designated VGAM GENE, on one or more VGAM67 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[1796] It is yet further appreciated that a function of VGAM67 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM67 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM67 correlate with, and may be deduced from, the identity of the host target genes which VGAM67 binds and inhibits, and the

function of these host target genes, as elaborated herein–below.

[1797] Nucleotide sequences of the VGAM67 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM67 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM67 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM67 are further described hereinbelow with reference to Table 1.

[1798] Nucleotide sequences of host target binding sites, such as BINDING SITE–I, BINDING SITE–II and BINDING SITE–III of Fig. 1, found on VGAM67 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM67 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[1799] As mentioned hereinabove with reference to Fig. 1, a function of VGAM67 gene, herein designated VGAM is inhibition of expression of VGAM67 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM67 correlate with, and may be deduced from, the identity of the target genes which VGAM67 binds and inhibits, and the function of these target genes, as elabo–

rated hereinbelow.

[1800] Giant Axonal Neuropathy (gigaxonin) (GAN, Accession NM_022041) is a VGAM67 host target gene. GAN BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GAN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GAN BINDING SITE, designated SEQ ID:1975, to the nucleotide sequence of VGAM67 RNA, herein designated VGAM RNA, also designated SEQ ID:402.

[1801] A function of VGAM67 is therefore inhibition of Giant Axonal Neuropathy (gigaxonin) (GAN, Accession NM_022041), a gene which plays an important role in neurofilament architecture. Accordingly, utilities of VGAM67 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GAN. The function of GAN has been established by previous studies. Giant axonal neuropathy (GAN; 256850), a severe autosomal recessive sensorineural neuropathy affecting both the peripheral nerves and the central nervous system, is characterized by neurofilament accumulation, leading to segmental distention of axons. The neuropathy is part of a

generalized disorganization of the cytoskeletal intermediate filaments (IFs), to which neurofilaments belong, as abnormal aggregation of multiple tissue-specific IFs has been reported in this disorder: vimentin (VIM; 193060) in endothelial cells, Schwann cells, and cultured skin fibroblasts, and glial fibrillary acidic protein (GFAP; 137780) in astrocytes (Prineas et al., 1976; Pena, 1982; Bousquet et al., 1996). Keratin intermediate filaments also seem to be altered, as most patients present characteristic curly or kinky hairs (Treiber-Held et al., 1994). Bomont et al. (2000) used a positional cloning approach to isolate a novel, ubiquitously expressed gene that encoded a protein they named gigaxonin and contained mutations associated with giant axonal neuropathy. Gigaxonin contains an N-terminal BTB (broad-complex, tramtrack, and bric-a-brac) domain followed by 6 kelch repeats, which were predicted to adopt a beta-propeller shape. Distantly related proteins sharing a similar domain organization have various functions associated with the cytoskeleton, predicting that gigaxonin is a novel and distinct cytoskeletal protein that may represent a general pathologic target for other neurodegenerative disorders with alterations in the neurofilament network.

- [1802] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:
- [1803] Bomont, P.; Cavalier, L.; Blondeau, F.; Ben Hamida, C.; Belal, S.; Tazir, M.; Demir, E.; Topaloglu, H.; Korinthenberg, R.; Tuysuz, B.; Landrieu, P.; Hentati, F.; Koenig, M. : The gene encoding gigaxonin, a new member of the cytoskeletal BTB/kelch repeat family, is mutated in giant axonal neuropathy. *Nature Genet.* 26: 370–374, 2000. ; and
- [1804] Bousquet, O.; Basseville, M.; Vila-Porcile, E.; Billette de Villemeur, T.; Hauw, J.-J.; Landrieu, P.; Portier, M.-M. : Aggregation of a subpopulation of vimentin filaments in cultured.
- [1805] Further studies establishing the function and utilities of GAN are found in John Hopkins OMIM database record ID 605379, and in cited publications numbered 2067–161 and 2068 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Isocitrate Dehydrogenase 3 (NAD+) Alpha (IDH3A, Accession NM_005530) is another VGAM67 host target gene. IDH3A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by IDH3A, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IDH3A BINDING SITE, designated SEQ ID:1222, to the nucleotide sequence of VGAM67 RNA, herein designated VGAM RNA, also designated SEQ ID:402.

[1806] Another function of VGAM67 is therefore inhibition of Isocitrate Dehydrogenase 3 (NAD⁺) Alpha (IDH3A, Accession NM_005530), a gene which decarboxylates isocitrate into alpha-ketoglutarate in the TCA cycle. Accordingly, utilities of VGAM67 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IDH3A. The function of IDH3A has been established by previous studies. Isocitrate dehydrogenases (EC 1.1.1.4.1 and EC 1.1.1.42) catalyze the oxidative decarboxylation of isocitrate into alpha-ketoglutarate. Thus, they are key enzymes in the tricarboxylic acid (TCA) cycle. In mammalian tissues, 3 kinds of isoenzymes exist, cytosolic NADP(+)-specific IDH (OMIM Ref. No. 147700), mitochondrial NADP(+)-specific IDH (OMIM Ref. No. 147650), and mitochondrial NAD(+)-specific IDH (IDH3). Among the mammalian IDH isoenzymes, IDH3 is thought to play a major role in isocitrate decarboxylation in the TCA cycle, since its activity is regulated by numerous al-

losteric regulators. IDH3, purified to homogeneity from pig heart, is a heterotetramer of the 2- α , 1- β , and 1- γ subunits, while NADP(+)-specific IDH found in either mitochondria or cytosol is a homodimer. Kim et al. (1995) characterized the cDNA clone for the α subunit (IDH3A), which encodes a mature protein with 339 amino acids (36,640 Da). Kim et al. (1995) had found that the human IDH3A sequence showed 44 and 30% amino acid identity to the monkey IDH3G (OMIM Ref. No. 602017) and bovine IDH2 (OMIM Ref. No. 147650) genes, respectively. Preliminary data using fluorescence in situ hybridization (FISH) supported the assignment to 15q26.1. By FISH, Huh et al. (1996) mapped the IDH3A gene to 15q25.1-q25.2

[1807] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[1808] Huh, T.-L.; Kim, Y.-O.; Oh, I.-U.; Song, B. J.; Inazawa, J. : Assignment of the human mitochondrial NAD(+)-specific isocitrate dehydrogenase α subunit (IDH3A) gene to 15q25.1-q25.2 by in situ hybridization. Genomics 31: 295-296, 1996. ; and

[1809] Kim, Y.-O.; Oh, I.-U.; Park, H.-S.; Jeng, J.; Song, B. J.; Huh,

T.-L. : Characterization of a cDNA clone for human NAD(+)-specific isocitrate dehydrogenase alpha-subunit and structural c.

[1810] Further studies establishing the function and utilities of IDH3A are found in John Hopkins OMIM database record ID 601149, and in cited publications numbered 1705-1706 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Peroxisome Biogenesis Factor 1 (PEX1, Accession NM_000466) is another VGAM67 host target gene. PEX1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PEX1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PEX1 BINDING SITE, designated SEQ ID:749, to the nucleotide sequence of VGAM67 RNA, herein designated VGAM RNA, also designated SEQ ID:402.

[1811] Another function of VGAM67 is therefore inhibition of Peroxisome Biogenesis Factor 1 (PEX1, Accession NM_000466). Accordingly, utilities of VGAM67 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PEX1. PYGO2 (Accession

XM_034083) is another VGAM67 host target gene. PYGO2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PYGO2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PYGO2 BINDING SITE, designated SEQ ID:2676, to the nucleotide sequence of VGAM67 RNA, herein designated VGAM RNA, also designated SEQ ID:402.

[1812] Another function of VGAM67 is therefore inhibition of PYGO2 (Accession XM_034083). Accordingly, utilities of VGAM67 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PYGO2. FLJ21477 (Accession NM_025153) is another VGAM67 host target gene. FLJ21477 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ21477, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21477 BINDING SITE, designated SEQ ID:2142, to the nucleotide sequence of VGAM67 RNA, herein designated VGAM RNA, also designated SEQ ID:402.

[1813] Another function of VGAM67 is therefore inhibition of FLJ21477 (Accession NM_025153). Accordingly, utilities of VGAM67 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21477. NS1-BP (Accession XM_051877) is another VGAM67 host target gene. NS1-BP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NS1-BP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NS1-BP BINDING SITE, designated SEQ ID:2953, to the nucleotide sequence of VGAM67 RNA, herein designated VGAM RNA, also designated SEQ ID:402.

[1814] Another function of VGAM67 is therefore inhibition of NS1-BP (Accession XM_051877). Accordingly, utilities of VGAM67 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NS1-BP. Unc-5 Homolog D (C. elegans) (UNC5D, Accession NM_080872) is another VGAM67 host target gene. UNC5D BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by UNC5D, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of UNC5D BINDING SITE, designated SEQ ID:2391, to the nucleotide sequence of VGAM67 RNA, herein designated VGAM RNA, also designated SEQ ID:402.

[1815] Another function of VGAM67 is therefore inhibition of Unc-5 Homolog D (*C. elegans*) (UNC5D, Accession NM_080872). Accordingly, utilities of VGAM67 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UNC5D. LOC257451 (Accession XM_170960) is another VGAM67 host target gene. LOC257451 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC257451, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257451 BINDING SITE, designated SEQ ID:3678, to the nucleotide sequence of VGAM67 RNA, herein designated VGAM RNA, also designated SEQ ID:402.

[1816] Another function of VGAM67 is therefore inhibition of LOC257451 (Accession XM_170960). Accordingly, utilities of VGAM67 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LOC257451. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 68 (VGAM68) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[1817] VGAM68 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM68 was detected is described hereinabove with reference to Figs. 1–8.

[1818] VGAM68 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus. VGAM68 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[1819] VGAM68 gene encodes a VGAM68 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM68 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM68 precursor RNA is designated SEQ ID:54, and is provided hereinbelow with reference to the

sequence listing part. Nucleotide sequence SEQ ID:54 is located at position 10620 relative to the genome of Vaccinia Virus.

[1820] VGAM68 precursor RNA folds onto itself, forming VGAM68 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[1821] An enzyme complex designated DICER COMPLEX, `dices` the VGAM68 folded precursor RNA into VGAM68 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 86%) nucleotide sequence of VGAM68 RNA is designated SEQ ID:403, and is provided hereinbelow with reference to the sequence listing part.

[1822] VGAM68 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM68 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM68 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[1823] VGAM68 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM68 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM68 RNA is an accurate or a partial inverted-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM68 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of

a VGAM68 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR and 5' UTR regions.

[1824] The complementary binding of VGAM68 RNA, herein designated VGAM RNA, to host target binding sites on VGAM68 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM68 host target RNA into VGAM68 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[1825] It is appreciated that VGAM68 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM68 host target genes. The mRNA of each one of this plurality of VGAM68 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM68 RNA, herein designated VGAM RNA, and which when bound by VGAM68 RNA causes inhibition of translation of respective one or more VGAM68

host target proteins.

[1826] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM68 gene, herein designated VGAM GENE, on one or more VGAM68 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[1827] It is yet further appreciated that a function of VGAM68 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM68 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM68 correlate

with, and may be deduced from, the identity of the host target genes which VGAM68 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[1828] Nucleotide sequences of the VGAM68 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM68 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM68 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM68 are further described hereinbelow with reference to Table 1.

[1829] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM68 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM68 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[1830] As mentioned hereinabove with reference to Fig. 1, a function of VGAM68 gene, herein designated VGAM is inhibition of expression of VGAM68 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM68 correlate with, and may be deduced from, the

identity of the target genes which VGAM68 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[1831] Chorea Acanthocytosis (CHAC, Accession NM_015186) is a VGAM68 host target gene. CHAC BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CHAC, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CHAC BINDING SITE, designated SEQ ID:1612, to the nucleotide sequence of VGAM68 RNA, herein designated VGAM RNA, also designated SEQ ID:403.

[1832] A function of VGAM68 is therefore inhibition of Chorea Acanthocytosis (CHAC, Accession NM_015186), a gene which may regulate the cycling of proteins. Accordingly, utilities of VGAM68 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CHAC. The function of CHAC has been established by previous studies. Rampoldi et al. (2001) identified a novel gene in the choreoacanthocytosis (CHAC; 200150) critical region of 9q with an open reading frame of 9,525 nucleotides encoding a 3,174-amino acid protein. Alignment

of the RNA with the genomic sequence demonstrated that the gene is organized into 73 exons in a genomic region of about 250 kb. Northern blot analysis detected 2 bands of high molecular weight corresponding to 2 splice variants in all tissues analyzed. Additionally, RT-PCR detected expression in the erythrocyte precursor cell line K562.

Rampoldi et al. (2001) found 16 different mutations in individuals with choreoacanthocytosis. They showed that the CHAC gene encodes an evolutionarily conserved protein and suggested that this protein is involved in protein sorting. In a patient with choreoacanthocytosis (OMIM Ref. No. 200150), Rampoldi et al. (2001) found compound heterozygosity for a 269T→A transversion in exon 4 of the CHAC gene and an insertion of a T between nucleotides 6404 and 6405 in exon 48. The mutations resulted in an ile90→lys (I90K) amino acid change and a frameshift, respectively.

[1833] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[1834] Rampoldi, L.; Dobson-Stone, C.; Rubio, J. P.; Danek, A.; Chalmers, R. M.; Wood, N. W.; Verellen, C.; Ferrer, X.; Mallandrini, A.; Fabrizi, G. M.; Brown, R.; Vance, J.; Pericak-

Vance, M.; Rudolf, G.; Carre, S.; Alonso, E.; Manfredi, M.; Nemeth, A. H.; Monaco, A. P. : A conserved sorting-as-sociated protein is mutant in chorea-acanthocytosis. Nature Genet. 28: 119-120, 2001. ; and

[1835] Ueno, S.; Maruki, Y.; Nakamura, M.; Tomemori, Y.; Kamae, K.; Tanabe, H.; Yamashita, Y.; Matsuda, S.; Kaneko, S.; Sano, A. : The gene encoding a newly discovered protein, chorein, is mu.

[1836] Further studies establishing the function and utilities of CHAC are found in John Hopkins OMIM database record ID 605978, and in cited publications numbered 2375 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Gamma-glutamyl Carboxylase (GGCX, Accession NM_000821) is another VGAM68 host target gene. GGCX BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GGCX, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GGCX BINDING SITE, designated SEQ ID:778, to the nucleotide sequence of VGAM68 RNA, herein designated VGAM RNA, also designated SEQ ID:403.

[1837] Another function of VGAM68 is therefore inhibition of Gamma-glutamyl Carboxylase (GGCX, Accession NM_000821). Accordingly, utilities of VGAM68 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GGCX. Inositol 1,4,5-trisphosphate 3-kinase B (ITPKB, Accession NM_002221) is another VGAM68 host target gene. ITPKB BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ITPKB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ITPKB BINDING SITE, designated SEQ ID:911, to the nucleotide sequence of VGAM68 RNA, herein designated VGAM RNA, also designated SEQ ID:403.

[1838] Another function of VGAM68 is therefore inhibition of Inositol 1,4,5-trisphosphate 3-kinase B (ITPKB, Accession NM_002221), a gene which is a type B inositol 1,4,5-triphosphate 3 kinase. Accordingly, utilities of VGAM68 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ITPKB. The function of ITPKB has been established by previous studies. Takazawa et al. (1991) isolated a second inositol

1,4,5-trisphosphate 3-kinase cDNA from a human hippocampus cDNA library. Sequencing yielded an open reading frame encoding a 472-amino acid protein with a calculated relative mass of 53,451. The C-terminal part of this enzyme, referred to as 3-kinase-B, namely, residues 187-462, was 68% identical to 3-kinase-A (OMIM Ref. No. 147521) in amino acid sequence. By in situ hybridization, Erneux et al. (1992) mapped the ITPKB gene to 1q41-q43.

[1839] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[1840] Erneux, C.; Roeckel, N.; Takazawa, K.; Mailleux, P.; Vassart, G.; Mattei, M. G. : Localization of the genes for human inositol 1,4,5-trisphosphate 3-kinase A (ITPKA) and B (ITPKB) to chromosome regions 15q14-q21 and 1q41-q43, respectively, by in situ hybridization. *Genomics* 14: 546-547, 1992. ; and

[1841] Takazawa, K.; Perret, J.; Dumont, J. E.; Erneux, C. : Molecular cloning and expression of a new putative inositol 1,4,5-trisphosphate 3-kinase isoenzyme. *Biochem. J.* 278: 883-886, 1991.

[1842] Further studies establishing the function and utilities of ITPKB are found in John Hopkins OMIM database record ID

147522, and in cited publications numbered 15–16 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Potassium Voltage-gated Channel, Shaker-related Subfamily, Beta Member 1 (KCNAB1, Accession XM_027634) is another VGAM68 host target gene. KCNAB1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KCNAB1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KCNAB1 BINDING SITE, designated SEQ ID:2584, to the nucleotide sequence of VGAM68 RNA, herein designated VGAM RNA, also designated SEQ ID:403.

[1843] Another function of VGAM68 is therefore inhibition of Potassium Voltage-gated Channel, Shaker-related Subfamily, Beta Member 1 (KCNAB1, Accession XM_027634), a gene which is the regulatory beta subunit for a shaker-related voltage-gated potassium channel. Accordingly, utilities of VGAM68 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KCNAB1. The function of KCNAB1 has been established by previous studies. 'Shaker' and other voltage-

dependent potassium channel proteins help to determine the electrical properties of excitable cells and play additional physiologic roles in nonexcitable cell types. Voltage-activated, outwardly rectifying potassium channels (Kv) are heterooligomers that are assembled from alpha and beta subunits in a 1:1 molar ratio. Schultz et al. (1996) noted that mammals contain a large number of alpha-subunit potassium channel genes, often clustered within the genome, that may have arisen through local and chromosomal duplication events. The associated beta subunits modulate the gating properties and amplitudes of the Shaker potassium currents. England et al. (1995) cloned a human heart cDNA encoding a beta subunit that they designated Kv-beta-1.3. Sequence analysis revealed that Kv-beta-1.3 and the previously identified human Kv-beta-1 (England et al., 1995) and Kv-beta-3 (McCormack et al., 1995) subunits differ only at their N termini and are encoded by alternatively spliced mRNAs from a single gene. The authors suggested that Kv-beta-1 and Kv-beta-3 be renamed Kv-beta-1.1 and Kv-beta-1.2, respectively. The predicted 419-amino acid Kv-beta-1.3 subunit does not contain a hydrophobic domain and is likely to be a cytoplasmic protein, like other beta sub-

units. When coexpressed in *Xenopus* oocytes, the Kv-beta-1.3 subunit altered the functional properties of Kv1.5 (KCNA5; 176267), converting it from a delayed rectifier to a channel with rapid but partial inactivation. In addition, Kv-beta-1.3 converted the Kv1.5 outwardly rectifying current-voltage relationship to one showing strong inward rectification. England et al. (1995) concluded that Kv channel current diversity may arise from association with alternatively spliced Kv-beta subunits. By Northern blot analysis, Leicher et al. (1996) found that the KCNA1B gene was expressed as 3.4- and 3.8-kb mRNAs in human brain. The pattern of expression of Kv1-alpha and Kv-beta subunits suggested an intricate and cell-specific regulatory mechanism that produces distinct combinations of alpha and beta subunits in different nuclei of the brain. The Kv-beta-1.1 and Kv-beta-1.2 splice variants contain an N-terminal inactivating domain similar to that found in A-type Kv channels (see OMIM Ref. No. KCNA4; 176266). When coexpressed in mammalian cells, Kv-beta-1.1 and Kv-beta-1.2 conferred rapid inactivation on Kv1.5 channels, with different potencies

[1844] Full details of the abovementioned studies are described in the following publications, the disclosure of which are

hereby incorporated by reference:

- [1845] Leicher, T. Roeper, J.; Weber, K.; Wang, X.; Pongs, O. : Structural and functional characterization of human potassium channel subunit beta-1 (KCNA1B). *Neuropharmacology* 35: 787-795, 1996. ; and
- [1846] Schultz, D.; Litt, M.; Smith, L.; Thayer, M.; McCormack, K. : Localization of two potassium channel beta subunit genes, KCNA1B and KCNA2B. *Genomics* 31: 389-391, 1996.
- [1847] Further studies establishing the function and utilities of KCNAB1 are found in John Hopkins OMIM database record ID 601141, and in cited publications numbered 1592-656 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Killer Cell Lectin-like Receptor Subfamily C, Member 4 (KLRC4, Accession NM_013431) is another VGAM68 host target gene. KLRC4 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KLRC4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KLRC4 BINDING SITE, designated SEQ ID:1451, to the nucleotide sequence of VGAM68 RNA, herein designated VGAM RNA, also designated SEQ ID:403.

[1848] Another function of VGAM68 is therefore inhibition of Killer Cell Lectin-like Receptor Subfamily C, Member 4 (KLRC4, Accession NM_013431), a gene which is a receptor for the recognition of mhc class i hla-e molecules by nk cells and some cytotoxic t-cells. Accordingly, utilities of VGAM68 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KLRC4. The function of KLRC4 has been established by previous studies. Bauer et al. (1999) found that NKG2D is expressed on gamma/delta T cells, CD8-alpha (OMIM Ref. No. 186910)/-beta (OMIM Ref. No. 186730)-positive T cells, and natural killer cells and is a receptor for MICA (OMIM Ref. No. 600169). MICA binding to NKG2D activated cytolytic responses of gamma/delta T cells and NK cells against transfectants and epithelial tumor cells expressing MICA. The authors noted that these results define an activating immunoreceptor-MHC ligand interaction that may promote antitumor NK and T-cell responses. Wu et al. (1999) demonstrated that NKG2D and DAP10 (OMIM Ref. No. 604089) interact specifically to form an activating immunoreceptor complex. MIC engagement of NKG2D stimulates NK-cell and T-cell effector functions. Cytomegalovirus (CMV) infection induces the expression of

stress proteins such as HSP70 (OMIM Ref. No. 140550). By flow cytometric analysis, Groh et al. (2001) showed that CMV infection also induces MIC expression and a concurrent downregulation of MHC class I molecules on fibroblasts and endothelial cells. Immunohistochemical analysis of lung sections from patients with CMV interstitial pneumonitis confirmed that induction of MIC expression also occurs in vivo. Functional analysis of T-cell cytotoxicity against CMV-infected fibroblasts showed that early after infection when MIC expression was low, antibodies to MHC class I, but not to MIC or NKG2D, could block T cell-mediated cytotoxicity. As MIC expression increased, antibody masking of MIC or NKG2D reduced target cell lysis; anti-MHC class I antibodies further reduced cytotoxicity. The presence of MICA on stimulator cells also substantially enhanced cytokine release by T-cell clones, and anti-MIC antibody abrogated this production, suggesting that the MIC-NKG2D interaction provides an important costimulatory activity. Animal model experiments lend further support to the function of KLRC4. Colucci et al. (2002) noted that humans with mutations in ZAP70 (OMIM Ref. No. 176947) have T-cell immunodeficiency, that mice lacking Zap70 have blocked T-cell development, and that mice

lacking Syk (OMIM Ref. No. 600085) have a failure of B-cell development. NK cells express both molecules, which associate with immunoreceptor tyrosine-based activation motifs (ITAMs). Using mice deficient in both Zap70 and Syk, Colucci et al. (2002) observed NK cell activity comparable to that in wildtype mice. The mutant cells expressed Nkg2d and were able to lyse targets with and without Nkg2d ligands in vitro and in vivo. However, wildtype cells, but not the double-deficient cells, responded to CD16 (OMIM Ref. No. 146740) and Ly49d (see OMIM Ref. No. 604274) cross-linking with increased cytotoxicity, suggesting that these 2 ITAM-bearing receptors are unable to signal in the mutant cells. Inhibitors of PI3K or Src kinases blocked and, in combination, abrogated cytotoxic activity in the mutant cells, whereas inhibition of both kinases was required to reduce wildtype NK activity. Colucci et al. (2002) concluded that intracellular signaling in the adaptive immune system, i.e., in B and T cells, is fundamentally different from that in the NK cells of the innate immune system.

[1849] It is appreciated that the abovementioned animal model for KLRC4 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appre-

ciated from the publications sited hereinbelow.

[1850] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[1851] Colucci, F.; Schweighoffer, E.; Tomasello, E.; Turner, M.; Ortaldo, J. R.; Vivier, E.; Tybulewicz, V. L. J.; Di Santo, J. P. : Natural cytotoxicity uncoupled from the Syk and ZAP-70 intracellular kinases. *Nature Immun.* 3: 288-294, 2002. ; and

[1852] Groh, V.; Rhinehart, R.; Randolph-Habecker, J.; Topp, M. S.; Riddell, S. R.; Spies, T. : Costimulation of CD8-alpha-beta T cells by NKG2D via engagement by MIC induced on virus-infected.

[1853] Further studies establishing the function and utilities of KLRC4 are found in John Hopkins OMIM database record ID 602893, and in sited publications numbered 1801, 3055-1805, 600, 1806, 1852-57 and 602 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Myeloid Leukemia Factor 2 (MLF2, Accession NM_005439) is another VGAM68 host target gene. MLF2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MLF2, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MLF2 BINDING SITE, designated SEQ ID:1212, to the nucleotide sequence of VGAM68 RNA, herein designated VGAM RNA, also designated SEQ ID:403.

[1854] Another function of VGAM68 is therefore inhibition of Myeloid Leukemia Factor 2 (MLF2, Accession NM_005439). Accordingly, utilities of VGAM68 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MLF2. Nuclear Receptor Subfamily 1, Group I, Member 2 (NR1I2, Accession NM_003889) is another VGAM68 host target gene. NR1I2 BINDING SITE1 and NR1I2 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by NR1I2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NR1I2 BINDING SITE1 and NR1I2 BINDING SITE2, designated SEQ ID:1067 and SEQ ID:1971 respectively, to the nucleotide sequence of VGAM68 RNA, herein designated VGAM RNA, also designated SEQ ID:403.

[1855] Another function of VGAM68 is therefore inhibition of Nu-

clear Receptor Subfamily 1, Group I, Member 2 (NR1I2, Accession NM_003889), a gene which binds to a response element in the cyp3a4 gene promoter and activates its expression in response to a wide variety of endobiotics and xenobiotics. Accordingly, utilities of VGAM68 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NR1I2. The function of NR1I2 has been established by previous studies. Lehmann et al. (1998) identified a nuclear receptor, termed PXR, that binds to the rifampicin/dexamethasone response element in the CYP3A4 (OMIM Ref. No. 124010) promoter as a heterodimer with the 9-cis retinoic acid receptor RXR (see OMIM Ref. No. 180245). The human PXR is related to the mouse Pxr1, which they had cloned and shown to be activated by dexamethasone, pregnenolone 16-alpha-carbonitrile (PCN), and other compounds known to induce expression of the CYP3A1 gene, the predominant form of CYP3A in rat liver and intestine. Lehmann et al. (1998) isolated PXR clones from a human liver cDNA library. Amino acid sequence comparison showed that human PXR shared 96% and 76% sequence identity with mouse Pxr1 in the DNA-binding and ligand-binding domains, respectively. Initiation of translation at a CUG initi-

ation codon would yield a protein of 434 amino acids.

Northern blot analysis detected most abundant expression in liver, colon, and small intestine; transcripts of 2.6, 4.3, and 5 kb were present in each of these tissues. Lehmann et al. (1998) provided several lines of evidence indicating that human PXR serves as a key transcriptional regulator of the CYP3A4 gene. Animal model experiments lend further support to the function of NR1I2. The induction of CYP3A enzymes is species-specific and believed to involve 1 or more cellular factors, or receptor-like xenosensors. Xie et al. (2000) identified one such factor as the nuclear receptor Pxr and its human homolog SXR. Xie et al. (2000) showed that targeted disruption of the mouse Pxr gene abolished induction of CYP3A by prototypic inducers such as dexamethasone or pregnenolone-16- α -carbonitrile. In Pxr-null mice carrying a transgene for an activated form of human SXR, there was constitutive upregulation of CYP3A gene expression and enhanced protection against toxic xenobiotic compounds. Xie et al. (2000) demonstrated that species origin of the receptor, rather than the promoter structure of the CYP3A genes, dictates the species-specific pattern of CYP3A inducibility. Thus, they could generate 'humanized' trans-

genic mice that were responsive to human-specific inducers such as the antibiotic rifampicin. Xie et al. (2000) concluded that the SXR/Pxr genes encode the primary species-specific xenosensors that mediate the adaptive hepatic response, and may represent the critical biochemical mechanism of human xenoprotection.

[1856] It is appreciated that the abovementioned animal model for NR1I2 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[1857] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[1860] Further studies establishing the function and utilities of

NR1I2 are found in John Hopkins OMIM database record ID 603065, and in cited publications numbered 1918–1919, 785, 884, 192 and 1936 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. FHX (Accession NM_018416) is another VGAM68 host target gene. FHX BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FHX, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FHX BINDING SITE, designated SEQ ID:1825, to the nucleotide sequence of VGAM68 RNA, herein designated VGAM RNA, also designated SEQ ID:403.

[1861] Another function of VGAM68 is therefore inhibition of FHX (Accession NM_018416). Accordingly, utilities of VGAM68 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FHX. FLJ10352 (Accession NM_032142) is another VGAM68 host target gene. FLJ10352 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ10352, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING

SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10352 BINDING SITE, designated SEQ ID:2233, to the nucleotide sequence of VGAM68 RNA, herein designated VGAM RNA, also designated SEQ ID:403.

[1862] Another function of VGAM68 is therefore inhibition of FLJ10352 (Accession NM_032142). Accordingly, utilities of VGAM68 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10352. FLJ22127 (Accession NM_022775) is another VGAM68 host target gene. FLJ22127 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ22127, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22127 BINDING SITE, designated SEQ ID:2008, to the nucleotide sequence of VGAM68 RNA, herein designated VGAM RNA, also designated SEQ ID:403.

[1863] Another function of VGAM68 is therefore inhibition of FLJ22127 (Accession NM_022775). Accordingly, utilities of VGAM68 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22127.

Ganglioside-induced Differentiation-associated Protein 1-like 1 (GDAP1L1, Accession NM_024034) is another VGAM68 host target gene. GDAP1L1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GDAP1L1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GDAP1L1 BINDING SITE, designated SEQ ID:2043, to the nucleotide sequence of VGAM68 RNA, herein designated VGAM RNA, also designated SEQ ID:403.

[1864] Another function of VGAM68 is therefore inhibition of Ganglioside-induced Differentiation-associated Protein 1-like 1 (GDAP1L1, Accession NM_024034). Accordingly, utilities of VGAM68 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GDAP1L1. H-L(3)MBT (Accession NM_032107) is another VGAM68 host target gene. H-L(3)MBT BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by H-L(3)MBT, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of H-

L(3)MBT BINDING SITE, designated SEQ ID:2230, to the nucleotide sequence of VGAM68 RNA, herein designated VGAM RNA, also designated SEQ ID:403.

[1865] Another function of VGAM68 is therefore inhibition of H-L(3)MBT (Accession NM_032107). Accordingly, utilities of VGAM68 include diagnosis, prevention and treatment of diseases and clinical conditions associated with H-L(3)MBT. KIAA1340 (Accession XM_044836) is another VGAM68 host target gene. KIAA1340 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1340, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1340 BINDING SITE, designated SEQ ID:2846, to the nucleotide sequence of VGAM68 RNA, herein designated VGAM RNA, also designated SEQ ID:403.

[1866] Another function of VGAM68 is therefore inhibition of KIAA1340 (Accession XM_044836). Accordingly, utilities of VGAM68 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1340. Kinesin-like 7 (KNSL7, Accession NM_020242) is another VGAM68 host target gene. KNSL7 BINDING SITE

is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KNSL7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KNSL7 BINDING SITE, designated SEQ ID:1905, to the nucleotide sequence of VGAM68 RNA, herein designated VGAM RNA, also designated SEQ ID:403.

[1867] Another function of VGAM68 is therefore inhibition of Kinesin-like 7 (KNSL7, Accession NM_020242). Accordingly, utilities of VGAM68 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KNSL7. P5-1 (Accession NM_006674) is another VGAM68 host target gene. P5-1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by P5-1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of P5-1 BINDING SITE, designated SEQ ID:1322, to the nucleotide sequence of VGAM68 RNA, herein designated VGAM RNA, also designated SEQ ID:403.

[1868] Another function of VGAM68 is therefore inhibition of

P5-1 (Accession NM_006674). Accordingly, utilities of VGAM68 include diagnosis, prevention and treatment of diseases and clinical conditions associated with P5-1. PP1044 (Accession NM_021730) is another VGAM68 host target gene. PP1044 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PP1044, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PP1044 BINDING SITE, designated SEQ ID:1956, to the nucleotide sequence of VGAM68 RNA, herein designated VGAM RNA, also designated SEQ ID:403.

[1869] Another function of VGAM68 is therefore inhibition of PP1044 (Accession NM_021730). Accordingly, utilities of VGAM68 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PP1044. Signal-regulatory Protein Beta 1 (SIRPB1, Accession NM_006065) is another VGAM68 host target gene. SIRPB1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SIRPB1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of SIRPB1 BINDING SITE, designated SEQ ID:1272, to the nucleotide sequence of VGAM68 RNA, herein designated VGAM RNA, also designated SEQ ID:403.

[1870] Another function of VGAM68 is therefore inhibition of Signal-regulatory Protein Beta 1 (SIRPB1, Accession NM_006065). Accordingly, utilities of VGAM68 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SIRPB1. LOC148811 (Accession XM_086326) is another VGAM68 host target gene.

LOC148811 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC148811, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148811 BINDING SITE, designated SEQ ID:3126, to the nucleotide sequence of VGAM68 RNA, herein designated VGAM RNA, also designated SEQ ID:403.

[1871] Another function of VGAM68 is therefore inhibition of LOC148811 (Accession XM_086326). Accordingly, utilities of VGAM68 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC148811. LOC149711 (Accession XM_097720) is another VGAM68 host target gene. LOC149711 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC149711, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149711 BINDING SITE, designated SEQ ID:3315, to the nucleotide sequence of VGAM68 RNA, herein designated VGAM RNA, also designated SEQ ID:403.

[1872] Another function of VGAM68 is therefore inhibition of LOC149711 (Accession XM_097720). Accordingly, utilities of VGAM68 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149711. LOC150630 (Accession XM_097931) is another VGAM68 host target gene. LOC150630 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC150630, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150630 BINDING SITE, designated SEQ ID:3332, to the nucleotide sequence of VGAM68 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:403.

[1873] Another function of VGAM68 is therefore inhibition of LOC150630 (Accession XM_097931). Accordingly, utilities of VGAM68 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150630. LOC150819 (Accession XM_097954) is another VGAM68 host target gene. LOC150819 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC150819, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150819 BINDING SITE, designated SEQ ID:3333, to the nucleotide sequence of VGAM68 RNA, herein designated VGAM RNA, also designated SEQ ID:403.

[1874] Another function of VGAM68 is therefore inhibition of LOC150819 (Accession XM_097954). Accordingly, utilities of VGAM68 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150819. LOC154877 (Accession XM_098626) is another VGAM68 host target gene. LOC154877 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC154877, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC154877 BINDING SITE, designated SEQ ID:3373, to the nucleotide sequence of VGAM68 RNA, herein designated VGAM RNA, also designated SEQ ID:403.

[1875] Another function of VGAM68 is therefore inhibition of LOC154877 (Accession XM_098626). Accordingly, utilities of VGAM68 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC154877. LOC158327 (Accession XM_088548) is another VGAM68 host target gene. LOC158327 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC158327, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158327 BINDING SITE, designated SEQ ID:3216, to the nucleotide sequence of VGAM68 RNA, herein designated VGAM RNA, also designated SEQ ID:403.

[1876] Another function of VGAM68 is therefore inhibition of LOC158327 (Accession XM_088548). Accordingly, utilities of VGAM68 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LOC158327. LOC196540 (Accession XM_116933) is another VGAM68 host target gene. LOC196540 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC196540, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC196540 BINDING SITE, designated SEQ ID:3467, to the nucleotide sequence of VGAM68 RNA, herein designated VGAM RNA, also designated SEQ ID:403.

[1877] Another function of VGAM68 is therefore inhibition of LOC196540 (Accession XM_116933). Accordingly, utilities of VGAM68 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196540. LOC220394 (Accession XM_166936) is another VGAM68 host target gene. LOC220394 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC220394, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220394 BINDING SITE, designated SEQ ID:3581, to

the nucleotide sequence of VGAM68 RNA, herein designated VGAM RNA, also designated SEQ ID:403.

[1878] Another function of VGAM68 is therefore inhibition of LOC220394 (Accession XM_166936). Accordingly, utilities of VGAM68 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220394. LOC254428 (Accession XM_170932) is another VGAM68 host target gene. LOC254428 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC254428, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254428 BINDING SITE, designated SEQ ID:3677, to the nucleotide sequence of VGAM68 RNA, herein designated VGAM RNA, also designated SEQ ID:403.

[1879] Another function of VGAM68 is therefore inhibition of LOC254428 (Accession XM_170932). Accordingly, utilities of VGAM68 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254428. LOC92405 (Accession XM_044914) is another VGAM68 host target gene. LOC92405 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by LOC92405, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92405 BINDING SITE, designated SEQ ID:2848, to the nucleotide sequence of VGAM68 RNA, herein designated VGAM RNA, also designated SEQ ID:403.

[1880] Another function of VGAM68 is therefore inhibition of LOC92405 (Accession XM_044914). Accordingly, utilities of VGAM68 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92405. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 69 (VGAM69) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[1881] VGAM69 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM69 was detected is described hereinabove with reference to Figs. 1–8.

[1882] VGAM69 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Vaccinia Virus. VGAM69 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[1883] VGAM69 gene encodes a VGAM69 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM69 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM69 precursor RNA is designated SEQ ID:55, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:55 is located at position 180452 relative to the genome of Vaccinia Virus.

[1884] VGAM69 precursor RNA folds onto itself, forming VGAM69 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[1885] An enzyme complex designated DICER COMPLEX, `dices`

the VGAM69 folded precursor RNA into VGAM69 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 85%) nucleotide sequence of VGAM69 RNA is designated SEQ ID:404, and is provided hereinbelow with reference to the sequence listing part.

[1886] VGAM69 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM69 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM69 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[1887] VGAM69 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM69 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide

sequence of VGAM69 RNA is an accurate or a partial inverted-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM69 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM69 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR and 5' UTR regions.

[1888] The complementary binding of VGAM69 RNA, herein designated VGAM RNA, to host target binding sites on VGAM69 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM69 host target RNA into VGAM69 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target

protein is therefore outlined by a broken line.

[1889] It is appreciated that VGAM69 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM69 host target genes. The mRNA of each one of this plurality of VGAM69 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM69 RNA, herein designated VGAM RNA, and which when bound by VGAM69 RNA causes inhibition of translation of respective one or more VGAM69 host target proteins.

[1890] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM69 gene, herein designated VGAM GENE, on one or more VGAM69 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression

of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[1891] It is yet further appreciated that a function of VGAM69 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM69 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM69 correlate with, and may be deduced from, the identity of the host target genes which VGAM69 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[1892] Nucleotide sequences of the VGAM69 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM69 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM69 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM69 are further described hereinbelow with reference to Table 1.

[1893] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on VGAM69 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM69 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[1894] As mentioned hereinabove with reference to Fig. 1, a function of VGAM69 gene, herein designated VGAM is inhibition of expression of VGAM69 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM69 correlate with, and may be deduced from, the identity of the target genes which VGAM69 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[1895] DKFZP434G1411 (Accession XM_166383) is a VGAM69 host target gene. DKFZP434G1411 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP434G1411, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434G1411 BINDING SITE, designated SEQ ID:3554, to the nucleotide sequence of VGAM69 RNA, herein designated VGAM RNA, also designated SEQ ID:404.

[1896] A function of VGAM69 is therefore inhibition of DK-FZP434G1411 (Accession XM_166383). Accordingly, utilities of VGAM69 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434G1411. DKFZP564I052 (Accession XM_039660) is another VGAM69 host target gene. DKFZP564I052 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DK-FZP564I052, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP564I052 BINDING SITE, designated SEQ ID:2760, to the nucleotide sequence of VGAM69 RNA, herein designated VGAM RNA, also designated SEQ ID:404.

[1897] Another function of VGAM69 is therefore inhibition of DK-FZP564I052 (Accession XM_039660). Accordingly, utilities of VGAM69 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DK-FZP564I052. Kelch-like 8 (Drosophila) (KLHL8, Accession XM_031735) is another VGAM69 host target gene. KLHL8 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KLHL8, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KLHL8 BINDING SITE, designated SEQ ID:2639, to the nucleotide sequence of VGAM69 RNA, herein designated VGAM RNA, also designated SEQ ID:404.

[1898] Another function of VGAM69 is therefore inhibition of Kelch-like 8 (Drosophila) (KLHL8, Accession XM_031735). Accordingly, utilities of VGAM69 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KLHL8. Extracellular Link Domain Containing 1 (XLKD1, Accession NM_006691) is another VGAM69 host target gene. XLKD1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by XLKD1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of XLKD1 BINDING SITE, designated SEQ ID:1323, to the nucleotide sequence of VGAM69 RNA, herein designated VGAM RNA, also designated SEQ ID:404.

[1899] Another function of VGAM69 is therefore inhibition of Extracellular Link Domain Containing 1 (XLKD1, Accession

NM_006691). Accordingly, utilities of VGAM69 include diagnosis, prevention and treatment of diseases and clinical conditions associated with XLKD1. LOC51003 (Accession NM_016060) is another VGAM69 host target gene.

LOC51003 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC51003, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51003 BINDING SITE, designated SEQ ID:1658, to the nucleotide sequence of VGAM69 RNA, herein designated VGAM RNA, also designated SEQ ID:404.

[1900] Another function of VGAM69 is therefore inhibition of LOC51003 (Accession NM_016060). Accordingly, utilities of VGAM69 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51003. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 70 (VGAM70) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is

known in the art.

[1901] VGAM70 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM70 was detected is described hereinabove with reference to Figs. 1–8.

[1902] VGAM70 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus. VGAM70 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[1903] VGAM70 gene encodes a VGAM70 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM70 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM70 precursor RNA is designated SEQ ID:56, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:56 is located at position 12513 relative to the genome of Vaccinia Virus.

[1904] VGAM70 precursor RNA folds onto itself, forming VGAM70 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin struc-

ture`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[1905] An enzyme complex designated DICER COMPLEX, `dices` the VGAM70 folded precursor RNA into VGAM70 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of VGAM70 RNA is designated SEQ ID:405, and is provided hereinbelow with reference to the sequence listing part.

[1906] VGAM70 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM70 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM70 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING

and 3`UTR respectively.

[1907] VGAM70 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM70 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM70 RNA is an accurate or a partial inverted-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM70 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM70 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[1908] The complementary binding of VGAM70 RNA, herein des-

ignated VGAM RNA, to host target binding sites on VGAM70 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM70 host target RNA into VGAM70 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[1909] It is appreciated that VGAM70 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM70 host target genes. The mRNA of each one of this plurality of VGAM70 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM70 RNA, herein designated VGAM RNA, and which when bound by VGAM70 RNA causes inhibition of translation of respective one or more VGAM70 host target proteins.

[1910] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM70 gene, herein designated VGAM GENE, on one or more VGAM70 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known

non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[1911] It is yet further appreciated that a function of VGAM70 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM70 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM70 correlate with, and may be deduced from, the identity of the host target genes which VGAM70 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[1912] Nucleotide sequences of the VGAM70 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM70 RNA, herein designated VGAM RNA, and

a schematic representation of the secondary folding of VGAM70 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM70 are further described hereinbelow with reference to Table 1.

[1913] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM70 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM70 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[1914] As mentioned hereinabove with reference to Fig. 1, a function of VGAM70 gene, herein designated VGAM is inhibition of expression of VGAM70 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM70 correlate with, and may be deduced from, the identity of the target genes which VGAM70 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[1915] Sialidase 3 (membrane sialidase) (NEU3, Accession NM_006656) is a VGAM70 host target gene. NEU3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NEU3, correspond-

ing to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NEU3 BINDING SITE, designated SEQ ID:1319, to the nucleotide sequence of VGAM70 RNA, herein designated VGAM RNA, also designated SEQ ID:405.

[1916] A function of VGAM70 is therefore inhibition of Sialidase 3 (membrane sialidase) (NEU3, Accession NM_006656). Accordingly, utilities of VGAM70 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NEU3. Choline Phosphotransferase 1 (CHPT1, Accession NM_020244) is another VGAM70 host target gene. CHPT1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CHPT1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CHPT1 BINDING SITE, designated SEQ ID:1906, to the nucleotide sequence of VGAM70 RNA, herein designated VGAM RNA, also designated SEQ ID:405.

[1917] Another function of VGAM70 is therefore inhibition of Choline Phosphotransferase 1 (CHPT1, Accession

NM_020244). Accordingly, utilities of VGAM70 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CHPT1. LOC143310 (Accession XM_084485) is another VGAM70 host target gene.

LOC143310 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC143310, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC143310 BINDING SITE, designated SEQ ID:3057, to the nucleotide sequence of VGAM70 RNA, herein designated VGAM RNA, also designated SEQ ID:405.

[1918] Another function of VGAM70 is therefore inhibition of LOC143310 (Accession XM_084485). Accordingly, utilities of VGAM70 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC143310. LOC152578 (Accession XM_098241) is another VGAM70 host target gene. LOC152578 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC152578, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC152578 BINDING SITE, designated SEQ ID:3361, to the nucleotide sequence of VGAM70 RNA, herein designated VGAM RNA, also designated SEQ ID:405.

[1919] Another function of VGAM70 is therefore inhibition of LOC152578 (Accession XM_098241). Accordingly, utilities of VGAM70 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152578. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 71 (VGAM71) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[1920] VGAM71 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM71 was detected is described hereinabove with reference to Figs. 1–8.

[1921] VGAM71 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus. VGAM71 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[1922] VGAM71 gene encodes a VGAM71 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM71 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM71 precursor RNA is designated SEQ ID:57, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:57 is located at position 14150 relative to the genome of Vaccinia Virus.

[1923] VGAM71 precursor RNA folds onto itself, forming VGAM71 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[1924] An enzyme complex designated DICER COMPLEX, `dices` the VGAM71 folded precursor RNA into VGAM71 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of VGAM71 RNA is designated SEQ ID:406, and is provided hereinbelow with reference to the sequence listing part.

[1925] VGAM71 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM71 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM71 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[1926] VGAM71 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM71 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM71 RNA is an accurate or a partial inverted-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration,

Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM71 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM71 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[1927] The complementary binding of VGAM71 RNA, herein designated VGAM RNA, to host target binding sites on VGAM71 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM71 host target RNA into VGAM71 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[1928] It is appreciated that VGAM71 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM71 host target genes. The mRNA of each one of this plurality of VGAM71 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM71 RNA, herein designated VGAM RNA, and which when bound by VGAM71 RNA causes inhibition of translation of respective one or more VGAM71 host target proteins.

[1929] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM71 gene, herein designated VGAM GENE, on one or more VGAM71 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective:

Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[1930] It is yet further appreciated that a function of VGAM71 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM71 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM71 correlate with, and may be deduced from, the identity of the host target genes which VGAM71 binds and inhibits, and the function of these host target genes, as elaborated herein–below.

[1931] Nucleotide sequences of the VGAM71 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM71 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM71 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM71 are further described hereinbelow with reference to Table 1.

[1932] Nucleotide sequences of host target binding sites, such as BINDING SITE–I, BINDING SITE–II and BINDING SITE–III of Fig. 1, found on VGAM71 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM71 RNA, herein desig–

nated VGAM RNA, are described hereinbelow with reference to Table 2.

[1933] As mentioned hereinabove with reference to Fig. 1, a function of VGAM71 gene, herein designated VGAM is inhibition of expression of VGAM71 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM71 correlate with, and may be deduced from, the identity of the target genes which VGAM71 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[1934] HNF3A (Accession XM_007360) is a VGAM71 host target gene. HNF3A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HNF3A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HNF3A BINDING SITE, designated SEQ ID:2543, to the nucleotide sequence of VGAM71 RNA, herein designated VGAM RNA, also designated SEQ ID:406.

[1935] A function of VGAM71 is therefore inhibition of HNF3A (Accession XM_007360), a gene which activates transcription for a number of liver genes. Accordingly, utilities of

VGAM71 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HNF3A. The function of HNF3A has been established by previous studies. The transcription factors Hnf3a and Gata4 (OMIM Ref. No. 600576) are the earliest known to bind the albumin gene enhancer in liver precursor cells in mouse embryos. To determine how they access sites in silent chromatin, Cirillo et al. (2002) assembled nucleosome arrays containing albumin enhancer sequences and compacted them with linker histone. Hnf3a and Gata4, but not human NF1 (see OMIM Ref. No. 600727), mouse Cebp-beta (OMIM Ref. No. 189965), or yeast GAL4-AH, bound their sites in compacted chromatin and opened the local nucleosomal domain in the absence of ATP-dependent enzymes. The authors showed that the ability of Hnf3a to open chromatin is mediated by a high-affinity DNA-binding site and by the C-terminal domain of the protein, which binds histones H3 and H4. They concluded that factors that potentiate transcription in development are inherently capable of initiating chromatin opening events. Mincheva et al. (1997) used fluorescence in situ hybridization to map HNF3A to human chromosome 14q12-q13. This chromosomal region contains a cluster

of forkhead domain transcription factors including FKHL1 (OMIM Ref. No. 164874) and FKHL2 (OMIM Ref. No. 600779). By analysis of RFLPs in interspecific backcross mice, Avraham et al. (1992) mapped the mouse Hnf3-alpha gene to chromosome 12.

[1936] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[1937] Cirillo, L. A.; Lin, F. R.; Cuesta, I.; Friedman, D.; Jarnik, M.; Zaret, K. S. : Opening of compacted chromatin by early developmental transcription factors HNF3(FoxA) and GATA-4. Molec. Cell 9: 279-289, 2002. ; and

[1938] Mincheva, A.; Lichter, P.; Schutz, G.; Kaestner, K. H. : Assignment of the human genes for hepatocyte nuclear factor 3-alpha, -beta, and -gamma (HNF3A, HNF3B, HNF3G) to 14q12-q13, 20p11, a.

[1939] Further studies establishing the function and utilities of HNF3A are found in John Hopkins OMIM database record ID 602294, and in cited publications numbered 2289, 222 and 2290-2291 listed in the bibliography section herein-below, which are also hereby incorporated by reference. Mucin 12 (MUC12, Accession XM_168546) is another VGAM71 host target gene. MUC12 BINDING SITE is HOST

TARGET binding site found in the 3' untranslated region of mRNA encoded by MUC12, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MUC12 BINDING SITE, designated SEQ ID:3643, to the nucleotide sequence of VGAM71 RNA, herein designated VGAM RNA, also designated SEQ ID:406.

[1940] Another function of VGAM71 is therefore inhibition of Mucin 12 (MUC12, Accession XM_168546). Accordingly, utilities of VGAM71 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MUC12. Osteoglycin (osteoinductive factor, mimecan) (OGN, Accession NM_033014) is another VGAM71 host target gene. OGN BINDING SITE1 through OGN BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by OGN, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OGN BINDING SITE1 through OGN BINDING SITE3, designated SEQ ID:2307, SEQ ID:1467 and SEQ ID:2059 respectively, to the nucleotide sequence of VGAM71 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:406.

[1941] Another function of VGAM71 is therefore inhibition of Osteoglycin (osteoinductive factor, mimecan) (OGN, Accession NM_033014), a gene which induces ectopic bone formation in conjunction with transforming growth factor beta. Accordingly, utilities of VGAM71 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OGN. The function of OGN has been established by previous studies. Bovine osteoinductive factor (OIF) induces ectopic bone formation in conjunction with TGFB1 (OMIM Ref. No. 190180) or TGFB2 (OMIM Ref. No. 190220) (Bentz et al., 1989). Using primers based on the sequence of purified bovine OIF, Madisen et al. (1990) isolated a human OIF cDNA clone by RT-PCR of osteosarcoma cell mRNA. The human gene encodes a predicted 298-amino acid precursor protein that is processed into a 103-amino acid mature protein with 96% identity to the bovine protein. On Northern blots, 3 OIF mRNAs are found exclusively in 2 human osteosarcoma cell lines. By FISH, Tasheva et al. (2000) mapped the mimecan gene to 9q22. Pellegata et al. (2000) cloned the human OGN gene and mapped it to a region approximately 1.1 Mb telomeric of WI-532 and approximately 700 kb centromeric of D9S197

in 9q22.31.

- [1942] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:
- [1943] Madisen, L.; Neubauer, M.; Plowman, G.; Rosen, D.; Segarini, P.; Dasch, J.; Thompson, A.; Ziman, J.; Bentz, H.; Purchio, A. F. : Molecular cloning of a novel bone-forming compound: osteoinductive factor. DNA Cell Biol. 9: 303–309, 1990. ; and
- [1944] Pellegata, N. S.; Dieguez–Lucena, J. L.; Joensuu, T.; Lau, S.; Montgomery, K. T.; Krahe, R.; Kivela, T.; Kucherlapati, R.; Forsius, H.; de la Chapelle, A. : Mutations in KERA, encoding.
- [1945] Further studies establishing the function and utilities of OGN are found in John Hopkins OMIM database record ID 602383, and in cited publications numbered 1293–1294, 78 and 1346 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Protein Tyrosine Phosphatase, Receptor Type, A (PTPRA, Accession NM_080840) is another VGAM71 host target gene. PTPRA BINDING SITE1 through PTPRA BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PTPRA, corre-

sponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PTPRA BINDING SITE1 through PTPRA BINDING SITE3, designated SEQ ID:2389, SEQ ID:2390 and SEQ ID:2344 respectively, to the nucleotide sequence of VGAM71 RNA, herein designated VGAM RNA, also designated SEQ ID:406.

[1946] Another function of VGAM71 is therefore inhibition of Protein Tyrosine Phosphatase, Receptor Type, A (PTPRA, Accession NM_080840), a gene which is the human homolog of the murine PTPase. Accordingly, utilities of VGAM71 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTPRA. The function of PTPRA has been established by previous studies. Vital cellular functions such as cell proliferation and signal transduction are regulated in part by the balance between the activities of protein-tyrosine kinases (PTK) and protein-tyrosine phosphatases (OMIM Ref. No. PTPase). Oncogenesis can result from an imbalance. There are 2 classes of PTPase molecules: low molecular weight proteins with a single conserved phosphatase domain such as T-cell protein-tyrosine phosphatase (PTPT;

176887), and high molecular weight receptor-linked PTPases with 2 tandemly repeated conserved domains separated by 56 to 57 amino acids. Examples of the latter group include leukocyte-common antigen (PTPRC; 151460) and leukocyte antigen related tyrosine phosphatase (PTPRF; 179590). Matthews et al. (1990) cloned the human homolog of the murine PTPase termed LRP by them. Its cDNA sequence predicted a protein of 793 amino acids with an unglycosylated molecular mass of 87,500 kD Matthews et al. (1990). The protein contains a 121-residue extracellular domain, a single transmembrane segment, and 2 tandem intracytoplasmic catalytic domains. By study of rodent-human somatic cell hybrids, Jirik et al. (1990) localized PTPA/LRP to chromosome 20p13. Other family members located on chromosome 20 include SRC (OMIM Ref. No. 190090), HCK (OMIM Ref. No. 142370), and PTP1B (OMIM Ref. No. 176885). The LRP protein is ubiquitously expressed and thus likely plays a fundamental role in the physiology of all cells. With a leukocyte common antigen (LCA) probe, Kaplan et al. (1990) sequenced cDNA encoding the alpha enzyme isolated from a human brain stem cDNA library under conditions of reduced hybridization stringency. LRP encodes an

802-amino acid polypeptide. Kaplan et al. (1990) localized the RPTase- α gene to human chromosome 20pter-20q12 by analysis of its segregation pattern in rodent-human somatic cell hybrids. Rao et al. (1992) regionalized the assignment of PTPA to the distal portion of 20p (20pter-p12) by both radioactive and fluorescence in situ hybridization. By in situ hybridization, Jirik et al. (1992) localized the PTPA gene to 20p13. With the mapping of PAX1 167411 to mouse chromosome 2, Schnittger et al. (1992) found that the homolog of PTPA is also located on mouse chromosome 2, which confirms the exceptional homology between human chromosome 20 and the distal segment of mouse chromosome 2.

- [1947] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:
- [1948] Matthews, R. J.; Cahir, E. D.; Thomas, M. L. : Identification of an additional member of the protein-tyrosine-phosphatase family: evidence for alternative splicing in the tyrosine phosphatase domain. Proc. Nat. Acad. Sci. 87: 4444-4448, 1990. ; and
- [1949] Schnittger, S.; Rao, V. V. N. G.; Deutsch, U.; Gruss, P.; Balling, R.; Hansmann, I. : PAX1, a member of the paired

box-containing class of developmental control genes, is mapped to human ch.

[1950] Further studies establishing the function and utilities of PTPRA are found in John Hopkins OMIM database record ID 176884, and in cited publications numbered 2500–2501, 249 and 2502–2504 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. FLJ22457 (Accession NM_024901) is another VGAM71 host target gene. FLJ22457 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ22457, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22457 BINDING SITE, designated SEQ ID:2106, to the nucleotide sequence of VGAM71 RNA, herein designated VGAM RNA, also designated SEQ ID:406.

[1951] Another function of VGAM71 is therefore inhibition of FLJ22457 (Accession NM_024901). Accordingly, utilities of VGAM71 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22457. Lipase, Endothelial (LIPG, Accession NM_006033) is another VGAM71 host target gene. LIPG BINDING SITE is

HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LIPG, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LIPG BINDING SITE, designated SEQ ID:1266, to the nucleotide sequence of VGAM71 RNA, herein designated VGAM RNA, also designated SEQ ID:406.

[1952] Another function of VGAM71 is therefore inhibition of Lipase, Endothelial (LIPG, Accession NM_006033). Accordingly, utilities of VGAM71 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LIPG. MGC4643 (Accession NM_032715) is another VGAM71 host target gene. MGC4643 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC4643, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC4643 BINDING SITE, designated SEQ ID:2271, to the nucleotide sequence of VGAM71 RNA, herein designated VGAM RNA, also designated SEQ ID:406.

[1953] Another function of VGAM71 is therefore inhibition of

MGC4643 (Accession NM_032715). Accordingly, utilities of VGAM71 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC4643. LOC143888 (Accession XM_084669) is another VGAM71 host target gene. LOC143888 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC143888, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC143888 BINDING SITE, designated SEQ ID:3064, to the nucleotide sequence of VGAM71 RNA, herein designated VGAM RNA, also designated SEQ ID:406.

[1954] Another function of VGAM71 is therefore inhibition of LOC143888 (Accession XM_084669). Accordingly, utilities of VGAM71 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC143888. LOC149619 (Accession XM_097690) is another VGAM71 host target gene. LOC149619 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC149619, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC149619 BINDING SITE, designated SEQ ID:3311, to the nucleotide sequence of VGAM71 RNA, herein designated VGAM RNA, also designated SEQ ID:406.

[1955] Another function of VGAM71 is therefore inhibition of LOC149619 (Accession XM_097690). Accordingly, utilities of VGAM71 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149619. LOC91464 (Accession XM_038589) is another VGAM71 host target gene. LOC91464 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC91464, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91464 BINDING SITE, designated SEQ ID:2740, to the nucleotide sequence of VGAM71 RNA, herein designated VGAM RNA, also designated SEQ ID:406.

[1956] Another function of VGAM71 is therefore inhibition of LOC91464 (Accession XM_038589). Accordingly, utilities of VGAM71 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91464. Fig. 1 further provides a conceptual descrip-

tion of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 72 (VGAM72) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[1957] VGAM72 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM72 was detected is described hereinabove with reference to Figs. 1–8.

[1958] VGAM72 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus. VGAM72 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[1959] VGAM72 gene encodes a VGAM72 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM72 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM72 precursor RNA is designated SEQ ID:58, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:58 is located at position 14074 relative to the genome of Vac–

cinia Virus.

[1960] VGAM72 precursor RNA folds onto itself, forming VGAM72 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[1961] An enzyme complex designated DICER COMPLEX, `dices` the VGAM72 folded precursor RNA into VGAM72 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 70%) nucleotide sequence of VGAM72 RNA is designated SEQ ID:407, and is provided hereinbelow with reference to the sequence listing part.

[1962] VGAM72 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA,

VGAM72 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM72 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[1963] VGAM72 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM72 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM72 RNA is an accurate or a partial inverted-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM72 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM72 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig.

1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[1964] The complementary binding of VGAM72 RNA, herein designated VGAM RNA, to host target binding sites on VGAM72 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM72 host target RNA into VGAM72 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[1965] It is appreciated that VGAM72 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM72 host target genes. The mRNA of each one of this plurality of VGAM72 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM72 RNA, herein designated VGAM RNA, and which when bound by VGAM72 RNA causes inhibition of translation of respective one or more VGAM72 host target proteins.

[1966] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM72 gene, herein designated VGAM GENE, on one or more VGAM72 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[1967] It is yet further appreciated that a function of VGAM72 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM72 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM72 correlate with, and may be deduced from, the identity of the host target genes which VGAM72 binds and inhibits, and the

function of these host target genes, as elaborated herein–below.

[1968] Nucleotide sequences of the VGAM72 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM72 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM72 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM72 are further described hereinbelow with reference to Table 1.

[1969] Nucleotide sequences of host target binding sites, such as BINDING SITE–I, BINDING SITE–II and BINDING SITE–III of Fig. 1, found on VGAM72 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM72 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[1970] As mentioned hereinabove with reference to Fig. 1, a function of VGAM72 gene, herein designated VGAM is inhibition of expression of VGAM72 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM72 correlate with, and may be deduced from, the identity of the target genes which VGAM72 binds and inhibits, and the function of these target genes, as elabo–

rated hereinbelow.

[1971] Claudin 1 (CLDN1, Accession NM_021101) is a VGAM72 host target gene. CLDN1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CLDN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CLDN1 BINDING SITE, designated SEQ ID:1940, to the nucleotide sequence of VGAM72 RNA, herein designated VGAM RNA, also designated SEQ ID:407.

[1972] A function of VGAM72 is therefore inhibition of Claudin 1 (CLDN1, Accession NM_021101). Accordingly, utilities of VGAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CLDN1. KIAA1706 (Accession XM_166595) is another VGAM72 host target gene. KIAA1706 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1706, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1706 BINDING SITE, designated SEQ ID:3577, to the nucleotide sequence of

VGAM72 RNA, herein designated VGAM RNA, also designated SEQ ID:407.

[1973] Another function of VGAM72 is therefore inhibition of KIAA1706 (Accession XM_166595). Accordingly, utilities of VGAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1706. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 73 (VGAM73) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[1974] VGAM73 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM73 was detected is described hereinabove with reference to Figs. 1–8.

[1975] VGAM73 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus. VGAM73 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[1976] VGAM73 gene encodes a VGAM73 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, VGAM73 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM73 precursor RNA is designated SEQ ID:59, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:59 is located at position 14338 relative to the genome of Vaccinia Virus.

[1977] VGAM73 precursor RNA folds onto itself, forming VGAM73 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[1978] An enzyme complex designated DICER COMPLEX, `dices` the VGAM73 folded precursor RNA into VGAM73 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of VGAM73 RNA is designated SEQ ID:408, and is provided hereinbelow with reference to the sequence listing part.

[1979] VGAM73 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM73 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM73 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[1980] VGAM73 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM73 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM73 RNA is an accurate or a partial inverted-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III

respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM73 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM73 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR and 5' UTR regions.

[1981] The complementary binding of VGAM73 RNA, herein designated VGAM RNA, to host target binding sites on VGAM73 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM73 host target RNA into VGAM73 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[1982] It is appreciated that VGAM73 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM73 host target genes. The mRNA of each one of this plurality of VGAM73 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM73 RNA, herein designated VGAM RNA, and which when bound by VGAM73 RNA causes inhibition of translation of respective one or more VGAM73 host target proteins.

[1983] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM73 gene, herein designated VGAM GENE, on one or more VGAM73 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[1984] It is yet further appreciated that a function of VGAM73 is

inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM73 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM73 correlate with, and may be deduced from, the identity of the host target genes which VGAM73 binds and inhibits, and the function of these host target genes, as elaborated herein—below.

[1985] Nucleotide sequences of the VGAM73 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM73 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM73 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM73 are further described hereinbelow with reference to Table 1.

[1986] Nucleotide sequences of host target binding sites, such as BINDING SITE–I, BINDING SITE–II and BINDING SITE–III of Fig. 1, found on VGAM73 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM73 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[1987] As mentioned hereinabove with reference to Fig. 1, a function of VGAM73 gene, herein designated VGAM is inhibition of expression of VGAM73 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM73 correlate with, and may be deduced from, the identity of the target genes which VGAM73 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[1988] UDP-Gal:betaGlcNAc Beta 1,3-galactosyltransferase, Polypeptide 5 (B3GALT5, Accession NM_033170) is a VGAM73 host target gene. B3GALT5 BINDING SITE1 through B3GALT5 BINDING SITE5 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by B3GALT5, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of B3GALT5 BINDING SITE1 through B3GALT5 BINDING SITE5, designated SEQ ID:2317, SEQ ID:1268, SEQ ID:2318, SEQ ID:2319 and SEQ ID:2321 respectively, to the nucleotide sequence of VGAM73 RNA, herein designated VGAM RNA, also designated SEQ ID:408.

[1989] A function of VGAM73 is therefore inhibition of UDP-

Gal:betaGlcNAc Beta 1,3-galactosyltransferase, Polypeptide 5 (B3GALT5, Accession NM_033170). Accordingly, utilities of VGAM73 include diagnosis, prevention and treatment of diseases and clinical conditions associated with B3GALT5. Origin Recognition Complex, Subunit 2-like (yeast) (ORC2L, Accession NM_006190) is another VGAM73 host target gene. ORC2L BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ORC2L, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ORC2L BINDING SITE, designated SEQ ID:1278, to the nucleotide sequence of VGAM73 RNA, herein designated VGAM RNA, also designated SEQ ID:408.

[1990] Another function of VGAM73 is therefore inhibition of Origin Recognition Complex, Subunit 2-like (yeast) (ORC2L, Accession NM_006190), a gene which is a subunit of the origin recognition complex and may be required for initiation of DNA replication. Accordingly, utilities of VGAM73 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ORC2L. The function of ORC2L has been established by previous

studies. The origin recognition complex (ORC) is a multi-protein assemblage identified in *S. cerevisiae* that binds to the ARS (autonomously replicating sequence) consensus, a DNA motif that is an essential part of yeast origins of replication. ORC binding has also been implicated in transcriptional silencing at certain yeast loci. One component of the ORC is a 72-kD protein designated ORC2, mutations of which disrupt silencing at the HMR-E silencer and cause cell cycle arrest between late G1 and the initiation of DNA replication. Takahara et al. (1996) isolated a cDNA from a mouse embryonic stem cell library and a human placenta library whose predicted 577-amino acid protein resembles the yeast sequence. The mouse and human sequences of the ORC2L (ORC2-like) proteins are 47.9% and 46.3% similar to yeast ORC2, respectively. Northern blots showed highest levels of ORC2L expression in testes. Dhar et al. (2001) used homologous recombination to replace the third exon encoding the initiator ATG of the ORC2 gene with a neomycin phosphotransferase gene in a colon carcinoma cell line. This hypomorphic mutation decreased ORC2 protein levels by 90%. The G1 phase of the cell cycle was prolonged, but there was no effect on the utilization of either the MYC (OMIM Ref. No. 190080) or beta-globin

(OMIM Ref. No. 141900) cellular origins of replication. Cells carrying the ORC2 mutation failed to support the replication of a plasmid bearing the oriP replicator of Epstein–Barr virus (EBV), and this defect could be rescued by reintroduction of ORC2. ORC2 specifically associated with oriP in cells, most likely through its interaction with EBV nuclear antigen–1. Geminin (OMIM Ref. No. 602842), an inhibitor of the mammalian replication initiation complex, inhibited replication from oriP. Therefore, ORC and the human replication initiation apparatus is required for replication from a viral origin of replication.

[1991] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[1992] Dhar, S. K.; Yoshida, K.; Machida, Y.; Khaira, P.; Chaudhuri, B.; Wohlschlegel, J. A.; Leffak, M.; Yates, J.; Dutta, A. : Replication from oriP of Epstein–Barr virus requires human ORC and is inhibited by geminin. Cell 106: 287–296, 2001. ; and

[1993] Takahara, K.; Bong, M.; Brevard, R.; Eddy, R. L.; Haley, L. L.; Sait, S. J.; Shows, T. B.; Hoffman, G. G.; Greenspan, D. S. : Mouse and human homologues of the yeast origin of replica.

[1994] Further studies establishing the function and utilities of ORC2L are found in John Hopkins OMIM database record ID 601182, and in cited publications numbered 2142–2145 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. PART1 (Accession NM_016590) is another VGAM73 host target gene. PART1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PART1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PART1 BINDING SITE, designated SEQ ID:1699, to the nucleotide sequence of VGAM73 RNA, herein designated VGAM RNA, also designated SEQ ID:408.

[1995] Another function of VGAM73 is therefore inhibition of PART1 (Accession NM_016590). Accordingly, utilities of VGAM73 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PART1. Solute Carrier Family 10 (sodium/bile acid cotransporter family), Member 1 (SLC10A1, Accession NM_003049) is another VGAM73 host target gene. SLC10A1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by SLC10A1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC10A1 BINDING SITE, designated SEQ ID:989, to the nucleotide sequence of VGAM73 RNA, herein designated VGAM RNA, also designated SEQ ID:408.

[1996] Another function of VGAM73 is therefore inhibition of Solute Carrier Family 10 (sodium/bile acid cotransporter family), Member 1 (SLC10A1, Accession NM_003049). Accordingly, utilities of VGAM73 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC10A1. FUS Interacting Protein (serine-arginine rich) 1 (FUSIP1, Accession NM_006625) is another VGAM73 host target gene. FUSIP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FUSIP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FUSIP1 BINDING SITE, designated SEQ ID:1314, to the nucleotide sequence of VGAM73 RNA, herein designated VGAM RNA, also designated SEQ ID:408.

[1997] Another function of VGAM73 is therefore inhibition of FUS Interacting Protein (serine-arginine rich) 1 (FUSIP1, Accession NM_006625). Accordingly, utilities of VGAM73 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FUSIP1. Retinoic Acid Induced 17 (RAI17, Accession XM_166091) is another VGAM73 host target gene. RAI17 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RAI17, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAI17 BINDING SITE, designated SEQ ID:3515, to the nucleotide sequence of VGAM73 RNA, herein designated VGAM RNA, also designated SEQ ID:408.

[1998] Another function of VGAM73 is therefore inhibition of Retinoic Acid Induced 17 (RAI17, Accession XM_166091). Accordingly, utilities of VGAM73 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAI17. LOC115811 (Accession NM_138451) is another VGAM73 host target gene. LOC115811 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by

LOC115811, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC115811 BINDING SITE, designated SEQ ID:2442, to the nucleotide sequence of VGAM73 RNA, herein designated VGAM RNA, also designated SEQ ID:408.

[1999] Another function of VGAM73 is therefore inhibition of LOC115811 (Accession NM_138451). Accordingly, utilities of VGAM73 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC115811. LOC256946 (Accession XM_170543) is another VGAM73 host target gene. LOC256946 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC256946, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256946 BINDING SITE, designated SEQ ID:3657, to the nucleotide sequence of VGAM73 RNA, herein designated VGAM RNA, also designated SEQ ID:408.

[2000] Another function of VGAM73 is therefore inhibition of LOC256946 (Accession XM_170543). Accordingly, utilities

of VGAM73 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256946. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 74 (VGAM74) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[2001] VGAM74 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM74 was detected is described hereinabove with reference to Figs. 1–8.

[2002] VGAM74 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus. VGAM74 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[2003] VGAM74 gene encodes a VGAM74 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM74 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM74 precursor RNA is designated SEQ

ID:60, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:60 is located at position 15206 relative to the genome of Vaccinia Virus.

[2004] VGAM74 precursor RNA folds onto itself, forming VGAM74 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[2005] An enzyme complex designated DICER COMPLEX, `dices` the VGAM74 folded precursor RNA into VGAM74 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of VGAM74 RNA is designated SEQ ID:409, and is provided hereinbelow with reference to the sequence list-

ing part.

[2006] VGAM74 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM74 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM74 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[2007] VGAM74 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM74 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM74 RNA is an accurate or a partial inverted-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM74 RNA, herein designated VGAM RNA, may have a different num-

ber of host target binding sites in untranslated regions of a VGAM74 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[2008] The complementary binding of VGAM74 RNA, herein designated VGAM RNA, to host target binding sites on VGAM74 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM74 host target RNA into VGAM74 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[2009] It is appreciated that VGAM74 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM74 host target genes. The mRNA of each one of this plurality of VGAM74 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM74 RNA, herein designated VGAM RNA, and which when bound by VGAM74 RNA causes in–

hibition of translation of respective one or more VGAM74 host target proteins.

[2010] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM74 gene, herein designated VGAM GENE, on one or more VGAM74 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[2011] It is yet further appreciated that a function of VGAM74 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM74 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific

functions, and accordingly utilities, of VGAM74 correlate with, and may be deduced from, the identity of the host target genes which VGAM74 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[2012] Nucleotide sequences of the VGAM74 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM74 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM74 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM74 are further described hereinbelow with reference to Table 1.

[2013] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM74 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM74 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[2014] As mentioned hereinabove with reference to Fig. 1, a function of VGAM74 gene, herein designated VGAM is inhibition of expression of VGAM74 target genes. It is appreciated that specific functions, and accordingly utilities,

of VGAM74 correlate with, and may be deduced from, the identity of the target genes which VGAM74 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[2015] Peroxisomal Biogenesis Factor 3 (PEX3, Accession NM_003630) is a VGAM74 host target gene. PEX3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PEX3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PEX3 BINDING SITE, designated SEQ ID:1044, to the nucleotide sequence of VGAM74 RNA, herein designated VGAM RNA, also designated SEQ ID:409.

[2016] A function of VGAM74 is therefore inhibition of Peroxisomal Biogenesis Factor 3 (PEX3, Accession NM_003630). Accordingly, utilities of VGAM74 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PEX3. Polycystic Kidney Disease 2-like 2 (PKD2L2, Accession NM_014386) is another VGAM74 host target gene. PKD2L2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PKD2L2, corresponding to a HOST TARGET

binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PKD2L2 BINDING SITE, designated SEQ ID:1497, to the nucleotide sequence of VGAM74 RNA, herein designated VGAM RNA, also designated SEQ ID:409.

[2017] Another function of VGAM74 is therefore inhibition of Polycystic Kidney Disease 2-like 2 (PKD2L2, Accession NM_014386). Accordingly, utilities of VGAM74 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PKD2L2. BA108L7.2 (Accession NM_030971) is another VGAM74 host target gene. BA108L7.2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BA108L7.2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BA108L7.2 BINDING SITE, designated SEQ ID:2179, to the nucleotide sequence of VGAM74 RNA, herein designated VGAM RNA, also designated SEQ ID:409.

[2018] Another function of VGAM74 is therefore inhibition of BA108L7.2 (Accession NM_030971). Accordingly, utilities

of VGAM74 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BA108L7.2. Isopentenyl–diphosphate Delta Isomerase (IDI1, Accession XM_040272) is another VGAM74 host target gene. IDI1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by IDI1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IDI1 BINDING SITE, designated SEQ ID:2776, to the nucleotide sequence of VGAM74 RNA, herein designated VGAM RNA, also designated SEQ ID:409.

[2019] Another function of VGAM74 is therefore inhibition of Isopentenyl–diphosphate Delta Isomerase (IDI1, Accession XM_040272). Accordingly, utilities of VGAM74 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IDI1. PRO0899 (Accession NM_018565) is another VGAM74 host target gene. PRO0899 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by PRO0899, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of PRO0899 BINDING SITE, designated SEQ ID:1846, to the nucleotide sequence of VGAM74 RNA, herein designated VGAM RNA, also designated SEQ ID:409.

[2020] Another function of VGAM74 is therefore inhibition of PRO0899 (Accession NM_018565). Accordingly, utilities of VGAM74 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO0899. SEC14-like 1 (*S. cerevisiae*) (SEC14L1, Accession NM_003003) is another VGAM74 host target gene. SEC14L1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SEC14L1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SEC14L1 BINDING SITE, designated SEQ ID:980, to the nucleotide sequence of VGAM74 RNA, herein designated VGAM RNA, also designated SEQ ID:409.

[2021] Another function of VGAM74 is therefore inhibition of SEC14-like 1 (*S. cerevisiae*) (SEC14L1, Accession NM_003003). Accordingly, utilities of VGAM74 include diagnosis, prevention and treatment of diseases and clinical

conditions associated with SEC14L1. LOC130074 (Accession XM_072228) is another VGAM74 host target gene. LOC130074 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC130074, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC130074 BINDING SITE, designated SEQ ID:3045, to the nucleotide sequence of VGAM74 RNA, herein designated VGAM RNA, also designated SEQ ID:409.

[2022] Another function of VGAM74 is therefore inhibition of LOC130074 (Accession XM_072228). Accordingly, utilities of VGAM74 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC130074. LOC222159 (Accession XM_168421) is another VGAM74 host target gene. LOC222159 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC222159, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222159 BINDING SITE, designated SEQ ID:3633, to

the nucleotide sequence of VGAM74 RNA, herein designated VGAM RNA, also designated SEQ ID:409.

[2023] Another function of VGAM74 is therefore inhibition of LOC222159 (Accession XM_168421). Accordingly, utilities of VGAM74 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222159. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 75 (VGAM75) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[2024] VGAM75 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM75 was detected is described hereinabove with reference to Figs. 1–8.

[2025] VGAM75 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus. VGAM75 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[2026] VGAM75 gene encodes a VGAM75 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, VGAM75 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM75 precursor RNA is designated SEQ ID:61, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:61 is located at position 14680 relative to the genome of Vaccinia Virus.

[2027] VGAM75 precursor RNA folds onto itself, forming VGAM75 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[2028] An enzyme complex designated DICER COMPLEX, `dices` the VGAM75 folded precursor RNA into VGAM75 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 89%) nucleotide sequence of VGAM75 RNA is designated SEQ ID:410, and is provided hereinbelow with reference to the sequence listing part.

[2029] VGAM75 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM75 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM75 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[2030] VGAM75 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM75 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM75 RNA is an accurate or a partial inverted-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III

respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM75 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM75 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR and 5' UTR regions.

[2031] The complementary binding of VGAM75 RNA, herein designated VGAM RNA, to host target binding sites on VGAM75 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM75 host target RNA into VGAM75 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[2032] It is appreciated that VGAM75 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM75 host target genes. The mRNA of each one of this plurality of VGAM75 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM75 RNA, herein designated VGAM RNA, and which when bound by VGAM75 RNA causes inhibition of translation of respective one or more VGAM75 host target proteins.

[2033] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM75 gene, herein designated VGAM GENE, on one or more VGAM75 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[2034] It is yet further appreciated that a function of VGAM75 is

inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM75 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM75 correlate with, and may be deduced from, the identity of the host target genes which VGAM75 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[2035] Nucleotide sequences of the VGAM75 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM75 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM75 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM75 are further described hereinbelow with reference to Table 1.

[2036] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM75 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM75 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[2037] As mentioned hereinabove with reference to Fig. 1, a function of VGAM75 gene, herein designated VGAM is inhibition of expression of VGAM75 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM75 correlate with, and may be deduced from, the identity of the target genes which VGAM75 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[2038] Ring Finger Protein 28 (RNF28, Accession NM_032588) is a VGAM75 host target gene. RNF28 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RNF28, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RNF28 BINDING SITE, designated SEQ ID:2263, to the nucleotide sequence of VGAM75 RNA, herein designated VGAM RNA, also designated SEQ ID:410.

[2039] A function of VGAM75 is therefore inhibition of Ring Finger Protein 28 (RNF28, Accession NM_032588), a gene which is a ubiquitin ligase and that it is expressed selectively in cardiac and skeletal muscle. Accordingly, utilities of VGAM75 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with RNF28. The function of RNF28 has been established by previous studies. To identify candidate molecular mediators of muscle atrophy, Bodine et al. (2001) performed transcript profiling. Although many genes were upregulated in a single rat model of atrophy, only a small subset was universal in all atrophy models (denervation, immobilization, and unweighting). Two of these genes encode ubiquitin ligases: MURF1, and a gene designated 'muscle atrophy F-box' (MAFBX; 606604). Bodine et al. (2001) generated mice deficient in Murf1 by targeted disruption. Murf1 $-/-$ mice were viable and fertile and appeared normal. They had normal growth curves relative to those of wildtype littermates, and skeletal muscles and heart muscle had normal weights and morphology. After denervation, Murf1 $-/-$ mice had significant muscle sparing relative to wildtype littermates at 14 days but not at 7 days. Bodine et al. (2001) demonstrated that MURF1 is a ubiquitin ligase and that it is expressed selectively in cardiac and skeletal muscle. Centner et al. (2001) found that RNF28 binds in vitro to the titin repeats A168/A169 adjacent to the titin kinase domain. In myofibrils, RNF28 is present within the periphery of the M-line lattice in close proximity to the

catalytic kinase domain of titin, within the Z-line lattice, and also in soluble form within the cytoplasm

[2040] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[2043] Further studies establishing the function and utilities of RNF28 are found in John Hopkins OMIM database record ID 606131, and in cited publications numbered 1501–150 and 1961 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. SWAP70 (Accession XM_049197) is another VGAM75 host target gene. SWAP70 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by

SWAP70, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SWAP70 BINDING SITE, designated SEQ ID:2916, to the nucleotide sequence of VGAM75 RNA, herein designated VGAM RNA, also designated SEQ ID:410.

[2044] Another function of VGAM75 is therefore inhibition of SWAP70 (Accession XM_049197), a gene which is involved not only in nuclear events but also in signaling in B-cell activation. Accordingly, utilities of VGAM75 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SWAP70. The function of SWAP70 has been established by previous studies. The B-cell receptor is composed of the immunoglobulin (Ig) heavy and light chains and the covalently bound accessory molecules Ig-alpha (CD79A; 112205) and Ig-beta (CD79B; 147245). Crosslinking of the B-cell receptor by antigens stimulates the activation of intracellular protein kinases. B-cell activation leads to hypermutation of the Ig variable regions and to heavy chain class switching, in which the Ig constant region of mu (IgM; OMIM Ref. No. 147020) is replaced by that of another class: gamma (IgG; OMIM Ref.

No. 147100), alpha (IgA; OMIM Ref. No. 146900), or epsilon (IgE; OMIM Ref. No. 147180). Class switching is achieved by a looping out and deletion mechanism between the switch region of mu and the switch region of the isotype that is to be expressed. Masat et al. (2000) explored the possibility that switch-associated protein-70 (OMIM Ref. No. SWAP70) acts as a link between the recognition of specific switch regions and causation of a DNA break. Swap70 had been isolated in the mouse as part of a complex that is able to promote recombination between 2 switch regions in vitro (Borggreve et al., 1998; Borggreve et al., 1999). By screening a human lymphoma cDNA library using mouse Swap70 sequences as the probe, Masat et al. (2000) isolated a cDNA encoding SWAP70. Although the 585-amino acid SWAP70 protein contains 3 nuclear localization signals, SWAP70 was found mainly in the cytoplasm in small resting B cells. On stimulation, SWAP70 translocated to the nucleus. In activated, class-switching B cell cultures, it was associated with membrane IgG, but not IgM. Masat et al. (2000) suggested that SWAP70 is involved not only in nuclear events but also in signaling in B-cell activation. Shinohara et al. (2002) demonstrated that SWAP70 specifically binds phosphatidylinositol-

3,4,5-triphosphate. On stimulation by growth factors, cytoplasmic SWAP70, which is dependent on phosphoinositide-3-hydroxykinase but independent of Ras (see OMIM Ref. No. 190020), moved to cell membrane rearrangements known as ruffles. However, mutant SWAP70 lacking the ability to bind phosphatidylinositol-

3,4,5-triphosphate blocked membrane ruffling induced by epidermal growth factor (EGF; 131530) or platelet-derived growth factor (see OMIM Ref. No. 173430). SWAP70 shows low homology with Rac-guanine nucleotide exchange factors, and catalyzes phosphatidylinositol-

3,4,5-triphosphate-dependent guanine nucleotide exchange to Rac (see OMIM Ref. No. 602048).

SWAP70-deficient fibroblasts showed impaired membrane ruffling after stimulation with EGF, and failed to activate Rac fully. Shinohara et al. (2002) concluded that SWAP70 is a different type of Rac-GEF which, independently of Ras, transduces signals from tyrosine kinase receptors to Rac.

[2045] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[2046] Masat, L.; Caldwell, J.; Armstrong, R.; Khoshnevisan, H.; Jessberger, R.; Herndier, B.; Wabl, M.; Ferrick, D. : Associ-

ation of SWAP-70 with the B cell antigen receptor complex. Proc. Nat. Acad. Sci. 97: 2180-2184, 2000. ; and

[2047] Shinohara, M.; Terada, Y.; Iwamatsu, A.; Shinohara, A.; Mochizuki, N.; Higuchi, M.; Gotoh, Y.; Ihara, S.; Nagata, S.; Itoh, H.; Fukui, Y.; Jessberger, R. : SWAP-70 is a guanine-nucleot.

[2048] Further studies establishing the function and utilities of SWAP70 are found in John Hopkins OMIM database record ID 604762, and in cited publications numbered 1645-1649 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. bA430M15.1 (Accession XM_084997) is another VGAM75 host target gene. bA430M15.1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by bA430M15.1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of bA430M15.1 BINDING SITE, designated SEQ ID:3072, to the nucleotide sequence of VGAM75 RNA, herein designated VGAM RNA, also designated SEQ ID:410.

[2049] Another function of VGAM75 is therefore inhibition of bA430M15.1 (Accession XM_084997). Accordingly, utili-

ties of VGAM75 include diagnosis, prevention and treatment of diseases and clinical conditions associated with bA430M15.1. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 76 (VGAM76) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[2050] VGAM76 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM76 was detected is described hereinabove with reference to Figs. 1–8.

[2051] VGAM76 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus. VGAM76 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[2052] VGAM76 gene encodes a VGAM76 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM76 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM76 precursor RNA is designated SEQ

ID:62, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:62 is located at position 15884 relative to the genome of Vaccinia Virus.

[2053] VGAM76 precursor RNA folds onto itself, forming VGAM76 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[2054] An enzyme complex designated DICER COMPLEX, `dices` the VGAM76 folded precursor RNA into VGAM76 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 75%) nucleotide sequence of VGAM76 RNA is designated SEQ ID:411, and is provided hereinbelow with reference to the sequence listing part.

[2055] VGAM76 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM76 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM76 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[2056] VGAM76 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM76 host target RNA, herein designated VGAM HOST TARGET RNA. This com-

plementary binding is due to the fact that the nucleotide sequence of VGAM76 RNA is an accurate or a partial inverted-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM76 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM76 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[2057] The complementary binding of VGAM76 RNA, herein designated VGAM RNA, to host target binding sites on VGAM76 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM76 host target RNA into VGAM76 host target protein, herein desig-

nated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[2058] It is appreciated that VGAM76 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM76 host target genes. The mRNA of each one of this plurality of VGAM76 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM76 RNA, herein designated VGAM RNA, and which when bound by VGAM76 RNA causes inhibition of translation of respective one or more VGAM76 host target proteins.

[2059] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM76 gene, herein designated VGAM GENE, on one or more VGAM76 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also

believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[2060] It is yet further appreciated that a function of VGAM76 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM76 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM76 correlate with, and may be deduced from, the identity of the host target genes which VGAM76 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[2061] Nucleotide sequences of the VGAM76 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM76 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM76 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM76 are further described hereinbelow with reference to Table 1.

[2062] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM76 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM76 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[2063] As mentioned hereinabove with reference to Fig. 1, a function of VGAM76 gene, herein designated VGAM is inhibition of expression of VGAM76 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM76 correlate with, and may be deduced from, the identity of the target genes which VGAM76 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[2064] Pregnancy Specific Beta-1-glycoprotein 1 (PSG1, Accession NM_006905) is a VGAM76 host target gene. PSG1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PSG1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PSG1 BINDING SITE, designated SEQ ID:1337, to the nucleotide sequence of VGAM76 RNA, herein designated

VGAM RNA, also designated SEQ ID:411.

[2065] A function of VGAM76 is therefore inhibition of Pregnancy Specific Beta-1-glycoprotein 1 (PSG1, Accession NM_006905), a gene which is a member of the pregnancy-specific glycoprotein (PSG) and CEA families. Accordingly, utilities of VGAM76 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PSG1. The function of PSG1 has been established by previous studies. The human placenta is a multi-hormonal endocrine organ which produces hormones, enzymes, and other molecules that support fetal survival and development. Chorionic gonadotropin (118850, 118860), placental lactogen (OMIM Ref. No. 150200), and placental alkaline phosphatase (OMIM Ref. No. 171800) are 3 of the best-known placental proteins. Immunological studies on the protein composition of the serum in human pregnancy revealed several so-called pregnancy-specific proteins, including pregnancy-specific beta-1-glycoprotein (PSBG). PSBG becomes detectable in serum during the first 2 to 3 weeks of pregnancy and increases as pregnancy progresses, rising to a very high level of 200 to 400 micrograms per milliliter. Although its exact physiologic role during pregnancy is unknown, the

high quantity produced by the placenta argues for its importance. PSBG isolated from human placenta consists of a set of at least 3 glycoproteins with apparent molecular masses of 72, 64, and 54 kD, respectively. The heterogeneity is confirmed by detection of 3 nonglycosylated polypeptides of 50, 48, and 36 kD, which can be immunoprecipitated by antiserum to placental PSBG obtained by in vitro translation of placental polyadenylated RNA. Watanabe and Chou (1988) examined the structural relationship of these proteins by the isolation and study of cDNA clones. The members of the CEA/PSG gene family have a characteristic N-terminal domain that is homologous to the immunoglobulin variable region. Khan et al. (1992) estimated the size of the PSG subfamily by identification of N-domain exons from isolated genomic clones and from total genomic DNA through PCR amplification and DNA sequence determination. They found that the PSG subfamily contains at least 11 different genes. For 7 of these, 2 DNA sequences differing from each other in 1 to 4 nucleotides were detected. Most likely they represent different alleles. All of the PSGs except PSG1, PSG4 (OMIM Ref. No. 176393), and PSG8 (OMIM Ref. No. 176397) contain the arginine-glycine-aspartic acid sequence at posi-

tion 93–95 corresponding to the complementarity determining region 3 of immunoglobulin. Parsimony analysis of 24 CEA and PSG sequences using 12 members of the immunoglobulin gene superfamily as out-groups to root the family tree showed that the N-domain of the CEA group genes evolved in one major branch and the PSG group genes in the other. Brandriff et al. (1992) estimated that the CEA–PSG gene family region spans 1.1 to 1.2 Mb. Using a high-resolution restriction fragment fingerprinting technique, Olsen et al. (1994) assembled 256 cosmids spanning the PSG region on 19q13.2 into a single 700-kb contig. FISH to sperm pronuclei and cosmid walking experiments indicated that this PSG contig is telomeric of CGM8 at the telomeric end of the CEA subgroup gene cluster. Detailed restriction mapping and hybridization with gene-specific probes indicated that the order of the 11 PSG genes in the contig is cen--PSG3 (OMIM Ref. No. 176392)--PSG8--PSG12 (PSG10; 176399)--PSG1--PSG6 (OMIM Ref. No. 176395)--PSG7 (OMIM Ref. No. 176396)--PSG13 (PSG11; 176401)--PSG2 (OMIM Ref. No. 176391)--PSG5 (OMIM Ref. No. 176394)--PSG4--PSG11 (PSG9; 176398)--tel. The PSG genes are tandemly oriented in a 5-prime to 3-prime direction from telomere to

centromere. The CEA subgroup gene CGM11 is located at the telomeric end of the PSG gene cluster, and 6 genes belonging to a third CEA family subgroup, namely CGM13 through CGM18 (later OMIM Ref. No. 109770), are interspersed among the PSG genes.

[2066] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[2069] Further studies establishing the function and utilities of PSG1 are found in John Hopkins OMIM database record ID 176390, and in cited publications numbered 2453–2455, 50 and 2456–2466 listed in the bibliography section hereinbelow, which are also hereby incorporated by refer–

ence.V-ral Simian Leukemia Viral Oncogene Homolog B (ras related; GTP binding protein) (RALB, Accession NM_002881) is another VGAM76 host target gene. RALB BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RALB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RALB BINDING SITE, designated SEQ ID:968, to the nucleotide sequence of VGAM76 RNA, herein designated VGAM RNA, also designated SEQ ID:411.

[2070] Another function of VGAM76 is therefore inhibition of V-ral Simian Leukemia Viral Oncogene Homolog B (ras related; GTP binding protein) (RALB, Accession NM_002881). Accordingly, utilities of VGAM76 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RALB. Carcinoembryonic Antigen-related Cell Adhesion Molecule 8 (CEACAM8, Accession NM_001816) is another VGAM76 host target gene. CEACAM8 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CEACAM8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Ta-

ble 2 illustrates the complementarity of the nucleotide sequences of CEACAM8 BINDING SITE, designated SEQ ID:859, to the nucleotide sequence of VGAM76 RNA, herein designated VGAM RNA, also designated SEQ ID:411.

[2071] Another function of VGAM76 is therefore inhibition of Carcinoembryonic Antigen-related Cell Adhesion Molecule 8 (CEACAM8, Accession NM_001816). Accordingly, utilities of VGAM76 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CEACAM8. LAT1-3TM (Accession NM_031211) is another VGAM76 host target gene. LAT1-3TM BINDING SITE1 and LAT1-3TM BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by LAT1-3TM, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LAT1-3TM BINDING SITE1 and LAT1-3TM BINDING SITE2, designated SEQ ID:2183 and SEQ ID:2827 respectively, to the nucleotide sequence of VGAM76 RNA, herein designated VGAM RNA, also designated SEQ ID:411.

[2072] Another function of VGAM76 is therefore inhibition of

LAT1-3TM (Accession NM_031211). Accordingly, utilities of VGAM76 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LAT1-3TM. MGC26651 (Accession NM_144642) is another VGAM76 host target gene. MGC26651 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC26651, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC26651 BINDING SITE, designated SEQ ID:2489, to the nucleotide sequence of VGAM76 RNA, herein designated VGAM RNA, also designated SEQ ID:411.

[2073] Another function of VGAM76 is therefore inhibition of MGC26651 (Accession NM_144642). Accordingly, utilities of VGAM76 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC26651. LOC197423 (Accession XM_085436) is another VGAM76 host target gene. LOC197423 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC197423, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC197423 BINDING SITE, designated SEQ ID:3090, to the nucleotide sequence of VGAM76 RNA, herein designated VGAM RNA, also designated SEQ ID:411.

[2074] Another function of VGAM76 is therefore inhibition of LOC197423 (Accession XM_085436). Accordingly, utilities of VGAM76 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC197423. LOC220565 (Accession XM_165417) is another VGAM76 host target gene. LOC220565 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC220565, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220565 BINDING SITE, designated SEQ ID:3495, to the nucleotide sequence of VGAM76 RNA, herein designated VGAM RNA, also designated SEQ ID:411.

[2075] Another function of VGAM76 is therefore inhibition of LOC220565 (Accession XM_165417). Accordingly, utilities of VGAM76 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220565. Fig. 1 further provides a conceptual descrip-

tion of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 77 (VGAM77) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[2076] VGAM77 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM77 was detected is described hereinabove with reference to Figs. 1–8.

[2077] VGAM77 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus. VGAM77 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[2078] VGAM77 gene encodes a VGAM77 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM77 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM77 precursor RNA is designated SEQ ID:63, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:63 is located at position 17339 relative to the genome of Vac–

cinia Virus.

[2079] VGAM77 precursor RNA folds onto itself, forming VGAM77 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[2080] An enzyme complex designated DICER COMPLEX, `dices` the VGAM77 folded precursor RNA into VGAM77 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of VGAM77 RNA is designated SEQ ID:412, and is provided hereinbelow with reference to the sequence listing part.

[2081] VGAM77 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA,

VGAM77 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM77 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[2082] VGAM77 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM77 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM77 RNA is an accurate or a partial inverted-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM77 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM77 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig.

1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[2083] The complementary binding of VGAM77 RNA, herein designated VGAM RNA, to host target binding sites on VGAM77 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM77 host target RNA into VGAM77 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[2084] It is appreciated that VGAM77 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM77 host target genes. The mRNA of each one of this plurality of VGAM77 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM77 RNA, herein designated VGAM RNA, and which when bound by VGAM77 RNA causes inhibition of translation of respective one or more VGAM77 host target proteins.

[2085] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM77 gene, herein designated VGAM GENE, on one or more VGAM77 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[2086] It is yet further appreciated that a function of VGAM77 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM77 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM77 correlate with, and may be deduced from, the identity of the host target genes which VGAM77 binds and inhibits, and the

function of these host target genes, as elaborated herein—below.

[2087] Nucleotide sequences of the VGAM77 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM77 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM77 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM77 are further described hereinbelow with reference to Table 1.

[2088] Nucleotide sequences of host target binding sites, such as BINDING SITE–I, BINDING SITE–II and BINDING SITE–III of Fig. 1, found on VGAM77 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM77 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[2089] As mentioned hereinabove with reference to Fig. 1, a function of VGAM77 gene, herein designated VGAM is inhibition of expression of VGAM77 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM77 correlate with, and may be deduced from, the identity of the target genes which VGAM77 binds and inhibits, and the function of these target genes, as elabo—

rated hereinbelow.

[2090] FLJ13215 (Accession NM_025004) is a VGAM77 host target gene. FLJ13215 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ13215, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13215 BINDING SITE, designated SEQ ID:2126, to the nucleotide sequence of VGAM77 RNA, herein designated VGAM RNA, also designated SEQ ID:412.

[2091] A function of VGAM77 is therefore inhibition of FLJ13215 (Accession NM_025004). Accordingly, utilities of VGAM77 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13215. Protein Tyrosine Phosphatase Type IVA, Member 1 (PTP4A1, Accession NM_003463) is another VGAM77 host target gene. PTP4A1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PTP4A1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PTP4A1 BINDING SITE, designated SEQ

ID:1027, to the nucleotide sequence of VGAM77 RNA, herein designated VGAM RNA, also designated SEQ ID:412.

[2092] Another function of VGAM77 is therefore inhibition of Protein Tyrosine Phosphatase Type IVA, Member 1 (PTP4A1, Accession NM_003463). Accordingly, utilities of VGAM77 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTP4A1. Stromal Cell Derived Factor Receptor 1 (SDFR1, Accession NM_012428) is another VGAM77 host target gene. SDFR1 BINDING SITE1 and SDFR1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by SDFR1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SDFR1 BINDING SITE1 and SDFR1 BINDING SITE2, designated SEQ ID:1430 and SEQ ID:1718 respectively, to the nucleotide sequence of VGAM77 RNA, herein designated VGAM RNA, also designated SEQ ID:412.

[2093] Another function of VGAM77 is therefore inhibition of Stromal Cell Derived Factor Receptor 1 (SDFR1, Accession NM_012428). Accordingly, utilities of VGAM77 include di-

agnosis, prevention and treatment of diseases and clinical conditions associated with SDFR1. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 78 (VGAM78) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[2094] VGAM78 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM78 was detected is described hereinabove with reference to Figs. 1–8.

[2095] VGAM78 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus. VGAM78 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[2096] VGAM78 gene encodes a VGAM78 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM78 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM78 precursor RNA is designated SEQ ID:64, and is provided hereinbelow with reference to the

sequence listing part. Nucleotide sequence SEQ ID:64 is located at position 17430 relative to the genome of Vaccinia Virus.

[2097] VGAM78 precursor RNA folds onto itself, forming VGAM78 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[2098] An enzyme complex designated DICER COMPLEX, `dices` the VGAM78 folded precursor RNA into VGAM78 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 88%) nucleotide sequence of VGAM78 RNA is designated SEQ ID:413, and is provided hereinbelow with reference to the sequence listing part.

[2099] VGAM78 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM78 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM78 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[2100] VGAM78 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM78 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM78 RNA is an accurate or a partial inverted-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM78 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of

a VGAM78 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR and 5' UTR regions.

[2101] The complementary binding of VGAM78 RNA, herein designated VGAM RNA, to host target binding sites on VGAM78 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM78 host target RNA into VGAM78 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[2102] It is appreciated that VGAM78 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM78 host target genes. The mRNA of each one of this plurality of VGAM78 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM78 RNA, herein designated VGAM RNA, and which when bound by VGAM78 RNA causes inhibition of translation of respective one or more VGAM78

host target proteins.

[2103] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM78 gene, herein designated VGAM GENE, on one or more VGAM78 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[2104] It is yet further appreciated that a function of VGAM78 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM78 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM78 correlate

with, and may be deduced from, the identity of the host target genes which VGAM78 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[2105] Nucleotide sequences of the VGAM78 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM78 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM78 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM78 are further described hereinbelow with reference to Table 1.

[2106] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM78 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM78 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[2107] As mentioned hereinabove with reference to Fig. 1, a function of VGAM78 gene, herein designated VGAM is inhibition of expression of VGAM78 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM78 correlate with, and may be deduced from, the

identity of the target genes which VGAM78 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[2108] DJ667H12.2 (Accession NM_019605) is a VGAM78 host target gene. DJ667H12.2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DJ667H12.2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DJ667H12.2 BINDING SITE, designated SEQ ID:1884, to the nucleotide sequence of VGAM78 RNA, herein designated VGAM RNA, also designated SEQ ID:413.

[2109] A function of VGAM78 is therefore inhibition of DJ667H12.2 (Accession NM_019605). Accordingly, utilities of VGAM78 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DJ667H12.2. KIAA1799 (Accession XM_059109) is another VGAM78 host target gene. KIAA1799 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1799, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of KIAA1799 BINDING SITE, designated SEQ ID:3003, to the nucleotide sequence of VGAM78 RNA, herein designated VGAM RNA, also designated SEQ ID:413.

[2110] Another function of VGAM78 is therefore inhibition of KIAA1799 (Accession XM_059109). Accordingly, utilities of VGAM78 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1799. Protein Phosphatase 1, Regulatory (inhibitor) Subunit 3B (PPP1R3B, Accession NM_024607) is another VGAM78 host target gene. PPP1R3B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PPP1R3B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PPP1R3B BINDING SITE, designated SEQ ID:2071, to the nucleotide sequence of VGAM78 RNA, herein designated VGAM RNA, also designated SEQ ID:413.

[2111] Another function of VGAM78 is therefore inhibition of Protein Phosphatase 1, Regulatory (inhibitor) Subunit 3B (PPP1R3B, Accession NM_024607). Accordingly, utilities of VGAM78 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with PPP1R3B. LOC144840 (Accession XM_084982) is another VGAM78 host target gene. LOC144840 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC144840, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144840 BINDING SITE, designated SEQ ID:3071, to the nucleotide sequence of VGAM78 RNA, herein designated VGAM RNA, also designated SEQ ID:413.

[2112] Another function of VGAM78 is therefore inhibition of LOC144840 (Accession XM_084982). Accordingly, utilities of VGAM78 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144840. LOC158674 (Accession XM_088638) is another VGAM78 host target gene. LOC158674 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC158674, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158674 BINDING SITE, designated SEQ ID:3222, to

the nucleotide sequence of VGAM78 RNA, herein designated VGAM RNA, also designated SEQ ID:413.

[2113] Another function of VGAM78 is therefore inhibition of LOC158674 (Accession XM_088638). Accordingly, utilities of VGAM78 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158674. LOC245757 (Accession XM_165443) is another VGAM78 host target gene. LOC245757 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC245757, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC245757 BINDING SITE, designated SEQ ID:3496, to the nucleotide sequence of VGAM78 RNA, herein designated VGAM RNA, also designated SEQ ID:413.

[2114] Another function of VGAM78 is therefore inhibition of LOC245757 (Accession XM_165443). Accordingly, utilities of VGAM78 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC245757. LOC81034 (Accession NM_030780) is another VGAM78 host target gene. LOC81034 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by LOC81034, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC81034 BINDING SITE, designated SEQ ID:2164, to the nucleotide sequence of VGAM78 RNA, herein designated VGAM RNA, also designated SEQ ID:413.

[2115] Another function of VGAM78 is therefore inhibition of LOC81034 (Accession NM_030780). Accordingly, utilities of VGAM78 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC81034. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 79 (VGAM79) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[2116] VGAM79 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM79 was detected is described hereinabove with reference to Figs. 1–8.

[2117] VGAM79 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Vaccinia Virus. VGAM79 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[2118] VGAM79 gene encodes a VGAM79 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM79 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM79 precursor RNA is designated SEQ ID:65, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:65 is located at position 17229 relative to the genome of Vaccinia Virus.

[2119] VGAM79 precursor RNA folds onto itself, forming VGAM79 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[2120] An enzyme complex designated DICER COMPLEX, `dices`

the VGAM79 folded precursor RNA into VGAM79 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 89%) nucleotide sequence of VGAM79 RNA is designated SEQ ID:414, and is provided hereinbelow with reference to the sequence listing part.

[2121] VGAM79 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM79 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM79 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[2122] VGAM79 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM79 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide

sequence of VGAM79 RNA is an accurate or a partial inverted-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM79 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM79 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR and 5' UTR regions.

[2123] The complementary binding of VGAM79 RNA, herein designated VGAM RNA, to host target binding sites on VGAM79 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM79 host target RNA into VGAM79 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target

protein is therefore outlined by a broken line.

[2124] It is appreciated that VGAM79 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM79 host target genes. The mRNA of each one of this plurality of VGAM79 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM79 RNA, herein designated VGAM RNA, and which when bound by VGAM79 RNA causes inhibition of translation of respective one or more VGAM79 host target proteins.

[2125] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM79 gene, herein designated VGAM GENE, on one or more VGAM79 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression

of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[2126] It is yet further appreciated that a function of VGAM79 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM79 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM79 correlate with, and may be deduced from, the identity of the host target genes which VGAM79 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[2127] Nucleotide sequences of the VGAM79 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM79 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM79 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM79 are further described hereinbelow with reference to Table 1.

[2128] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on VGAM79 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM79 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[2129] As mentioned hereinabove with reference to Fig. 1, a function of VGAM79 gene, herein designated VGAM is inhibition of expression of VGAM79 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM79 correlate with, and may be deduced from, the identity of the target genes which VGAM79 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[2130] Dystrobrevin, Beta (DTNB, Accession NM_033147) is a VGAM79 host target gene. DTNB BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DTNB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DTNB BINDING SITE, designated SEQ ID:2316, to the nucleotide sequence of VGAM79 RNA, herein designated VGAM RNA, also designated SEQ ID:414.

[2131] A function of VGAM79 is therefore inhibition of Dystrobrevin, Beta (DTNB, Accession NM_033147), a gene which is a part of a dystrophin-associated protein complex . Accordingly, utilities of VGAM79 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DTNB. The function of DTNB has been established by previous studies. Dystrophin, a component of muscle that is defective in Duchenne muscular dystrophy (DMD; 310200), binds to a complex of proteins and glycoproteins, the dystrophin-associated protein complex (DPC), which effectively forms a transmembrane link between the extracellular matrix, and the cytoskeleton of the muscle fiber. The DPC can be divided into 3 subcomplexes: the dystroglycan complex, the sarcoglycan complex, and the cytoplasmic complex. The dystroglycan complex consists of 2 proteins, alpha- and beta-dystroglycan (DAG1, 128239; DAG2, 600119), that bind to laminin and dystrophin, respectively. The sarcoglycan complex is composed of 4 transmembrane glycoproteins: alpha-, beta-, gamma-, and delta-sarcoglycan, and a 25-kD protein 25DAP. Mutations in all 4 sarcoglycan genes have been found in patients with different forms of limb-girdle muscular dystrophy. The cytoplasmic compo-

ment of the DPC is composed of the syntrophin family of related proteins and the dystrophin-related protein, dystrobrevin. Peters et al. (1997) described beta-dystrobrevin. They cloned cDNAs from human liver libraries that encode a 627-amino acid polypeptide with a predicted molecular weight of 71 kD. The protein copurified with the dystrobrevin short form, Dp71. The mammalian dystrobrevin genes encode several protein isoforms that are expressed in different tissues, including brain and muscle. Blake et al. (1998) designated the isoform expressed in muscle as alpha-dystrobrevin and used the designation beta-dystrobrevin for the dystrophin-related protein they found to be abundantly expressed in brain and other tissues but not in muscle. Beta-dystrobrevin is encoded by a 2.5-kb alternatively spliced transcript that is found throughout the brain. In common with dystrophin, beta-dystrobrevin is found in neurons of the cortex and hippocampal formation, but it is not found in the brain microvasculature. In the brain, beta-dystrobrevin coprecipitates with the dystrophin isoforms Dp71 and Dp140. The findings of Blake et al. (1998) indicated that the composition of the dystrophin-associated protein complex in the brain differs from that in muscle. Because beta-

dystrobrevin and dystrophin are expressed in similar populations of neurons in the hippocampus and cortex, it is possible that beta-dystrobrevin interacts directly with dystrophin. If this is the case, then beta-dystrobrevin levels may be reduced in DMD patients similar to the reduction in sarcolemmal staining seen with other components of the DPC in dystrophic muscle. The findings may be relevant to the cognitive dysfunction affecting many patients with Duchenne muscular dystrophy.

[2132] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[2133] Blake, D. J.; Nawrotzki, R.; Loh, N. Y.; Gorecki, D. C.; Davies, K. E. : Beta-dystrobrevin, a member of the dystrophin-related protein family. *Proc. Nat. Acad. Sci.* 95: 241-246, 1998. ; and

[2135] Further studies establishing the function and utilities of DTNB are found in John Hopkins OMIM database record ID 602415, and in cited publications numbered 650-232

listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Nuclear Antigen Sp100 (SP100, Accession NM_003113) is another VGAM79 host target gene. SP100 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SP100, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SP100 BINDING SITE, designated SEQ ID:993, to the nucleotide sequence of VGAM79 RNA, herein designated VGAM RNA, also designated SEQ ID:414.

[2136] Another function of VGAM79 is therefore inhibition of Nuclear Antigen Sp100 (SP100, Accession NM_003113), a gene which may be involved in transduction of interferon action. Accordingly, utilities of VGAM79 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SP100. The function of SP100 has been established by previous studies. Seeler et al. (1998) showed that SP100 complexes with members of the HP1 family of nonhistone chromosomal proteins (e.g., CBX5, 604478). A variant of SP100, termed SP100B by the authors, contains additional 3-prime sequence encoding a

688-amino acid protein. A splice variant of SP100B, termed SP100-HMG, is joined to an 81-amino acid HMG1 (OMIM Ref. No. 163905)-like peptide by a 14-amino acid bridge. The HMG1-like domain is 87% identical and 93% similar to HMG1. SP100-HMG has the potential to be a DNA-binding protein. All 3 variants, SP100, SP100B, and SP100-HMG, colocalize with HP1 in NBs, suggesting that the N-terminal portion of SP100 is responsible for the interaction. HP1 expression is enhanced when SP100 synthesis is induced by interferon. By Northern blot analysis, Dent et al. (1996) found that SP100B, which they called LYSP100, is expressed only in lymphoid tissues (spleen, tonsil, and thymus), mature B-cell lines, and some T-cell lines, but not in brain, liver, muscle, or nonlymphoid cell lines. They noted that SP100 expression is widespread. By confocal immunofluorescence microscopy, they determined that a minority of the nuclear dots for SP100B overlapped with SP100 and PML, whereas most localized to another class of subnuclear structures, which they termed LANDs (LYSP100-associated nuclear domains), which are morphologically and spatially distinct from PML NBs.

- [2140] Further studies establishing the function and utilities of SP100 are found in John Hopkins OMIM database record ID 604585, and in cited publications numbered 1117–111 and 1039 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. KIAA1229 (Accession XM_030665) is another VGAM79 host target gene. KIAA1229 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1229, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

KIAA1229 BINDING SITE, designated SEQ ID:2620, to the nucleotide sequence of VGAM79 RNA, herein designated VGAM RNA, also designated SEQ ID:414.

[2141] Another function of VGAM79 is therefore inhibition of KIAA1229 (Accession XM_030665). Accordingly, utilities of VGAM79 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1229. LOC144776 (Accession XM_084964) is another VGAM79 host target gene. LOC144776 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC144776, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144776 BINDING SITE, designated SEQ ID:3070, to the nucleotide sequence of VGAM79 RNA, herein designated VGAM RNA, also designated SEQ ID:414.

[2142] Another function of VGAM79 is therefore inhibition of LOC144776 (Accession XM_084964). Accordingly, utilities of VGAM79 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144776. LOC199775 (Accession XM_114016) is another VGAM79 host target gene. LOC199775 BINDING

SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC199775, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC199775 BINDING SITE, designated SEQ ID:3432, to the nucleotide sequence of VGAM79 RNA, herein designated VGAM RNA, also designated SEQ ID:414.

[2143] Another function of VGAM79 is therefore inhibition of LOC199775 (Accession XM_114016). Accordingly, utilities of VGAM79 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC199775. LOC222236 (Accession XM_168636) is another VGAM79 host target gene. LOC222236 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC222236, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222236 BINDING SITE, designated SEQ ID:3651, to the nucleotide sequence of VGAM79 RNA, herein designated VGAM RNA, also designated SEQ ID:414.

[2144] Another function of VGAM79 is therefore inhibition of

LOC222236 (Accession XM_168636). Accordingly, utilities of VGAM79 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222236. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 80 (VGAM80) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[2145] VGAM80 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM80 was detected is described hereinabove with reference to Figs. 1–8.

[2146] VGAM80 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus. VGAM80 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[2147] VGAM80 gene encodes a VGAM80 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM80 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide se–

quence of VGAM80 precursor RNA is designated SEQ ID:66, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:66 is located at position 18904 relative to the genome of Vaccinia Virus.

[2148] VGAM80 precursor RNA folds onto itself, forming VGAM80 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[2149] An enzyme complex designated DICER COMPLEX, `dices` the VGAM80 folded precursor RNA into VGAM80 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 70%) nucleotide sequence of VGAM80 RNA is designated SEQ ID:415, and is

provided hereinbelow with reference to the sequence listing part.

[2150] VGAM80 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM80 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM80 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[2151] VGAM80 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM80 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM80 RNA is an accurate or a partial inverted-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM80 RNA,

herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM80 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR and 5' UTR regions.

[2152] The complementary binding of VGAM80 RNA, herein designated VGAM RNA, to host target binding sites on VGAM80 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM80 host target RNA into VGAM80 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[2153] It is appreciated that VGAM80 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM80 host target genes. The mRNA of each one of this plurality of VGAM80 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM80 RNA, herein designated VGAM

RNA, and which when bound by VGAM80 RNA causes inhibition of translation of respective one or more VGAM80 host target proteins.

[2154] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM80 gene, herein designated VGAM GENE, on one or more VGAM80 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[2155] It is yet further appreciated that a function of VGAM80 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM80 include diagnosis, prevention and

treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM80 correlate with, and may be deduced from, the identity of the host target genes which VGAM80 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[2156] Nucleotide sequences of the VGAM80 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM80 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM80 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM80 are further described hereinbelow with reference to Table 1.

[2157] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM80 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM80 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[2158] As mentioned hereinabove with reference to Fig. 1, a function of VGAM80 gene, herein designated VGAM is inhibition of expression of VGAM80 target genes. It is ap-

preciated that specific functions, and accordingly utilities, of VGAM80 correlate with, and may be deduced from, the identity of the target genes which VGAM80 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[2159] Cholinergic Receptor, Nicotinic, Alpha Polypeptide 1 (muscle) (CHRNA1, Accession NM_000079) is a VGAM80 host target gene. CHRNA1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CHRNA1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CHRNA1 BINDING SITE, designated SEQ ID:701, to the nucleotide sequence of VGAM80 RNA, herein designated VGAM RNA, also designated SEQ ID:415.

[2160] A function of VGAM80 is therefore inhibition of Cholinergic Receptor, Nicotinic, Alpha Polypeptide 1 (muscle) (CHRNA1, Accession NM_000079). Accordingly, utilities of VGAM80 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CHRNA1. Tumor Necrosis Factor (ligand) Superfamily, Member 9 (TNFSF9, Accession NM_003811) is another VGAM80 host

target gene. TNFSF9 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TNFSF9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TNFSF9 BINDING SITE, designated SEQ ID:1062, to the nucleotide sequence of VGAM80 RNA, herein designated VGAM RNA, also designated SEQ ID:415.

[2161] Another function of VGAM80 is therefore inhibition of Tumor Necrosis Factor (ligand) Superfamily, Member 9 (TNFSF9, Accession NM_003811). Accordingly, utilities of VGAM80 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TNFSF9. V-akt Murine Thymoma Viral Oncogene Homolog 3 (protein kinase B, gamma) (AKT3, Accession NM_005465) is another VGAM80 host target gene. AKT3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by AKT3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AKT3 BINDING SITE, designated SEQ ID:1214, to the nucleotide se-

quence of VGAM80 RNA, herein designated VGAM RNA, also designated SEQ ID:415.

[2162] Another function of VGAM80 is therefore inhibition of V-akt Murine Thymoma Viral Oncogene Homolog 3 (protein kinase B, gamma) (AKT3, Accession NM_005465). Accordingly, utilities of VGAM80 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AKT3. FLJ10103 (Accession NM_017996) is another VGAM80 host target gene. FLJ10103 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10103, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10103 BINDING SITE, designated SEQ ID:1773, to the nucleotide sequence of VGAM80 RNA, herein designated VGAM RNA, also designated SEQ ID:415.

[2163] Another function of VGAM80 is therefore inhibition of FLJ10103 (Accession NM_017996). Accordingly, utilities of VGAM80 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10103. FLJ22582 (Accession NM_025045) is another VGAM80 host target gene. FLJ22582 BINDING SITE is HOST TARGET

binding site found in the 3' untranslated region of mRNA encoded by FLJ22582, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22582 BINDING SITE, designated SEQ ID:2132, to the nucleotide sequence of VGAM80 RNA, herein designated VGAM RNA, also designated SEQ ID:415.

[2164] Another function of VGAM80 is therefore inhibition of FLJ22582 (Accession NM_025045). Accordingly, utilities of VGAM80 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22582. KIAA1371 (Accession XM_114371) is another VGAM80 host target gene. KIAA1371 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1371, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1371 BINDING SITE, designated SEQ ID:3454, to the nucleotide sequence of VGAM80 RNA, herein designated VGAM RNA, also designated SEQ ID:415.

[2165] Another function of VGAM80 is therefore inhibition of

KIAA1371 (Accession XM_114371). Accordingly, utilities of VGAM80 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1371. Microtubule-actin Crosslinking Factor 1 (MACF1, Accession NM_033024) is another VGAM80 host target gene. MACF1 BINDING SITE1 and MACF1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by MACF1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MACF1 BINDING SITE1 and MACF1 BINDING SITE2, designated SEQ ID:2308 and SEQ ID:1403 respectively, to the nucleotide sequence of VGAM80 RNA, herein designated VGAM RNA, also designated SEQ ID:415.

[2166] Another function of VGAM80 is therefore inhibition of Microtubule-actin Crosslinking Factor 1 (MACF1, Accession NM_033024). Accordingly, utilities of VGAM80 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MACF1. Nuclear Receptor Subfamily 2, Group C, Member 1 (NR2C1, Accession NM_003297) is another VGAM80 host target gene. NR2C1 BINDING SITE is HOST TARGET binding site found in the

3` untranslated region of mRNA encoded by NR2C1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NR2C1 BINDING SITE, designated SEQ ID:1006, to the nucleotide sequence of VGAM80 RNA, herein designated VGAM RNA, also designated SEQ ID:415.

[2167] Another function of VGAM80 is therefore inhibition of Nuclear Receptor Subfamily 2, Group C, Member 1 (NR2C1, Accession NM_003297). Accordingly, utilities of VGAM80 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NR2C1. P450RAI-2 (Accession NM_019885) is another VGAM80 host target gene. P450RAI-2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by P450RAI-2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of P450RAI-2 BINDING SITE, designated SEQ ID:1887, to the nucleotide sequence of VGAM80 RNA, herein designated VGAM RNA, also designated SEQ ID:415.

[2168] Another function of VGAM80 is therefore inhibition of

P450RAI-2 (Accession NM_019885). Accordingly, utilities of VGAM80 include diagnosis, prevention and treatment of diseases and clinical conditions associated with P450RAI-2. LOC152715 (Accession XM_087511) is another VGAM80 host target gene. LOC152715 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC152715, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152715 BINDING SITE, designated SEQ ID:3174, to the nucleotide sequence of VGAM80 RNA, herein designated VGAM RNA, also designated SEQ ID:415.

[2169] Another function of VGAM80 is therefore inhibition of LOC152715 (Accession XM_087511). Accordingly, utilities of VGAM80 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152715. LOC222166 (Accession XM_168425) is another VGAM80 host target gene. LOC222166 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC222166, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC222166 BINDING SITE, designated SEQ ID:3634, to the nucleotide sequence of VGAM80 RNA, herein designated VGAM RNA, also designated SEQ ID:415.

[2170] Another function of VGAM80 is therefore inhibition of LOC222166 (Accession XM_168425). Accordingly, utilities of VGAM80 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222166. LOC257042 (Accession XM_173039) is another VGAM80 host target gene. LOC257042 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC257042, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257042 BINDING SITE, designated SEQ ID:3719, to the nucleotide sequence of VGAM80 RNA, herein designated VGAM RNA, also designated SEQ ID:415.

[2171] Another function of VGAM80 is therefore inhibition of LOC257042 (Accession XM_173039). Accordingly, utilities of VGAM80 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257042. Fig. 1 further provides a conceptual descrip-

tion of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 81 (VGAM81) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[2172] VGAM81 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM81 was detected is described hereinabove with reference to Figs. 1–8.

[2173] VGAM81 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus. VGAM81 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[2174] VGAM81 gene encodes a VGAM81 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM81 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM81 precursor RNA is designated SEQ ID:67, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:67 is located at position 27652 relative to the genome of Vac–

cinia Virus.

[2175] VGAM81 precursor RNA folds onto itself, forming VGAM81 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[2176] An enzyme complex designated DICER COMPLEX, `dices` the VGAM81 folded precursor RNA into VGAM81 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 71%) nucleotide sequence of VGAM81 RNA is designated SEQ ID:416, and is provided hereinbelow with reference to the sequence listing part.

[2177] VGAM81 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA,

VGAM81 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM81 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[2178] VGAM81 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM81 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM81 RNA is an accurate or a partial inverted-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM81 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM81 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig.

1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR and 5' UTR regions.

[2179] The complementary binding of VGAM81 RNA, herein designated VGAM RNA, to host target binding sites on VGAM81 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM81 host target RNA into VGAM81 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[2180] It is appreciated that VGAM81 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM81 host target genes. The mRNA of each one of this plurality of VGAM81 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM81 RNA, herein designated VGAM RNA, and which when bound by VGAM81 RNA causes inhibition of translation of respective one or more VGAM81 host target proteins.

[2181] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM81 gene, herein designated VGAM GENE, on one or more VGAM81 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[2182] It is yet further appreciated that a function of VGAM81 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM81 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM81 correlate with, and may be deduced from, the identity of the host target genes which VGAM81 binds and inhibits, and the

function of these host target genes, as elaborated herein–below.

[2183] Nucleotide sequences of the VGAM81 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM81 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM81 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM81 are further described hereinbelow with reference to Table 1.

[2184] Nucleotide sequences of host target binding sites, such as BINDING SITE–I, BINDING SITE–II and BINDING SITE–III of Fig. 1, found on VGAM81 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM81 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[2185] As mentioned hereinabove with reference to Fig. 1, a function of VGAM81 gene, herein designated VGAM is inhibition of expression of VGAM81 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM81 correlate with, and may be deduced from, the identity of the target genes which VGAM81 binds and inhibits, and the function of these target genes, as elabo–

rated hereinbelow.

[2186] Coronin, Actin Binding Protein, 2B (CORO2B, Accession XM_035403) is a VGAM81 host target gene. CORO2B BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by CORO2B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CORO2B BINDING SITE, designated SEQ ID:2694, to the nucleotide sequence of VGAM81 RNA, herein designated VGAM RNA, also designated SEQ ID:416.

[2187] A function of VGAM81 is therefore inhibition of Coronin, Actin Binding Protein, 2B (CORO2B, Accession XM_035403), a gene which may play a role in the reorganization of neuronal actin structure. Accordingly, utilities of VGAM81 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CORO2B. The function of CORO2B has been established by previous studies. The Dictyostelium actin-binding protein coronin accumulates at the leading edges of motile cells and in crown-shaped extensions on the dorsal cell surface. Coronin is involved in cell motility, cytokinesis, and

phagocytosis, all of which depend on cytoskeletal rearrangement; see CORO1A (OMIM Ref. No. 605000). By screening a frontal cortex cDNA library with a brain-enriched clone showing similarity to Dictyostelium coronin, Nakamura et al. (1999) isolated a full-length cDNA encoding CORO2B, which they called CLIPINC. The predicted 475-amino acid CORO2B protein has an N-terminal domain containing 5 WD repeats and a succeeding domain with a tendency to form alpha helices. Northern blot analysis detected abundant expression of an approximately 4.0-kb CORO2B transcript in brain, with moderate expression in heart and ovary, and little or no expression in other tissues tested. In contrast, CORO1A is primarily expressed in immune system tissues, and CORO2A (OMIM Ref. No. 602159) is predominantly expressed in colon, prostate, and testis. Immunohistochemical analysis revealed Coro2a expression in mouse cerebral cortex, hippocampus, thalamus, olfactory bulb, and cerebellum, as well as in the inner nuclear layer of embryonic retina and embryonic olfactory bulb. Cosedimentation analysis demonstrated that CORO2B associates with F-actin. Immunofluorescence analysis indicated that CORO2B accumulates at neurite tips, at focal adhesions in association

with VCL (OMIM Ref. No. 193065), and along stress fibers.

[2188] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[2189] Nagase, T.; Ishikawa, K.; Suyama, M.; Kikuno, R.; Hiro-sawa, M.; Miyajima, N.; Tanaka, A.; Kotani, H.; Nomura, N.; Ohara, O. : Prediction of the coding sequences of unidentified human genes. XIII. The complete sequences of 100 new cDNA clones from brain which code for large proteins in vitro. DNA Res. 6: 63–70, 1999. ; and

[2190] Nakamura, T.; Takeuchi, K.; Muraoka, S.; Takezoe, H.; Takahashi, N.; Mori, N. : A neurally enriched coronin-like protein, ClipnC, is a novel candidate for an actin cytoskeleton-cortical.

[2191] Further studies establishing the function and utilities of CORO2B are found in John Hopkins OMIM database record ID 605002, and in cited publications numbered 1941 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Ephrin-B2 (EFNB2, Accession NM_004093) is another VGAM81 host target gene. EFNB2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by EFNB2, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EFNB2 BINDING SITE, designated SEQ ID:1084, to the nucleotide sequence of VGAM81 RNA, herein designated VGAM RNA, also designated SEQ ID:416.

[2192] Another function of VGAM81 is therefore inhibition of Ephrin-B2 (EFNB2, Accession NM_004093). Accordingly, utilities of VGAM81 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EFNB2. Glucagon Receptor (GCGR, Accession NM_000160) is another VGAM81 host target gene. GCGR BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by GCGR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GCGR BINDING SITE, designated SEQ ID:714, to the nucleotide sequence of VGAM81 RNA, herein designated VGAM RNA, also designated SEQ ID:416.

[2193] Another function of VGAM81 is therefore inhibition of Glucagon Receptor (GCGR, Accession NM_000160), a gene which controls the rate of hepatic glucose production and

insulin secretion. Accordingly, utilities of VGAM81 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GCGR. The function of GCGR has been established by previous studies. Hager et al. (1995) reported the association of a single heterozygous gly-to-ser missense mutation in the glucagon receptor gene with late-onset noninsulin-dependent diabetes mellitus (OMIM Ref. No. 125853). In a pooled set of French and Sardinian patients, the gly40-to-ser mutation showed association with NIDDM (chi square = 14.4, $P = 0.0001$). In 18 sibships from 9 French pedigrees, some evidence for linkage to diabetes was found. Receptor binding studies using cultured cells expressing the gly40-to-ser mutation demonstrated that this mutation results in a receptor that binds glucagon with a 3-fold lower affinity compared to the wildtype receptor. The physiologic effects of glucagon (GCG; 138030) are mediated through the glucagon receptor, a 480-amino acid protein that is a member of the superfamily of receptors characterized by a 7 transmembrane domain structure and by their coupling via GTP-binding proteins (G-proteins) to adenylyl cyclase. Menzel et al. (1994) cloned human glucagon receptor cDNA and demonstrated 85%

nucleotide and 91% amino acid identity with the rat sequence. By fluorescence in situ hybridization, they localized the GCGR gene to 17q25. An Alu variable poly(A) DNA polymorphism was identified in the gene. Use of the polymorphism in a study of CEPH families showed linkage between the polymorphism and markers localized to distal 17q. The receptor for glucagon-like peptide-1 (GLP1R; 138032), which is derived from the same proglucagon molecule, has structural similarities but does not bind peptides of related structure and similar function, such as glucagon. Lok et al. (1994) isolated a cDNA encoding a complete functional human glucagon receptor from a liver cDNA library by a combination of polymerase chain reaction and colony hybridization. The cDNA encoded a protein that had 80% identity to rat glucagon receptor, bound (125-I)-labeled glucagon, and transduced a signal leading to increases in the concentration of intracellular cyclic AMP. Southern blot analysis of human DNA suggested the presence of a single GCGR locus. By in situ hybridization, Lok et al. (1994) mapped the GCGR locus to 17q25. Analysis of the genomic sequence showed that the coding region spans over 5.5 kb and is interrupted by 12 introns.

[2194] Full details of the abovementioned studies are described

in the following publications, the disclosure of which are hereby incorporated by reference:

- [2195] Hager, J.; Hansen, L.; Vaisse, C.; Vionnet, N.; Philippi, A.; Poller, W.; Velho, G.; Carcassi, C.; Contu, L.; Julier, C.; Cambien, F.; Passa, P.; Lathrop, M.; Kindsvogel, W.; Deme-nais, F.; Nishimura, E.; Froguel, P. : A missense mutation in the glucagon receptor gene is associated with non-insulin-dependent diabetes mellitus. *Nature Genet.* 9: 299-304, 1995. ; and
- [2196] Lok, S.; Kuijper, J. L.; Jelinek, L. J.; Kramer, J. M.; Whitmore, T. E.; Sprecher, C. A.; Mathewes, S.; Grant, F. J.; Biggs, S. H.; Rosenberg, G. B.; Sheppard, P. O.; O'Hara, P. J.; Fos-
- [2197] Further studies establishing the function and utilities of GCGR are found in John Hopkins OMIM database record ID 138033, and in cited publications numbered 776-779 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Heme Oxygenase (decycling) 1 (HMOX1, Accession NM_002133) is another VGAM81 host target gene. HMOX1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HMOX1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complemen-

tarity of the nucleotide sequences of HMOX1 BINDING SITE, designated SEQ ID:901, to the nucleotide sequence of VGAM81 RNA, herein designated VGAM RNA, also designated SEQ ID:416.

[2198] Another function of VGAM81 is therefore inhibition of Heme Oxygenase (decycling) 1 (HMOX1, Accession NM_002133). Accordingly, utilities of VGAM81 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HMOX1. Heparan Sulfate (glucosamine) 3-O-sulfotransferase 2 (HS3ST2, Accession NM_006043) is another VGAM81 host target gene. HS3ST2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HS3ST2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HS3ST2 BINDING SITE, designated SEQ ID:1267, to the nucleotide sequence of VGAM81 RNA, herein designated VGAM RNA, also designated SEQ ID:416.

[2199] Another function of VGAM81 is therefore inhibition of Heparan Sulfate (glucosamine) 3-O-sulfotransferase 2 (HS3ST2, Accession NM_006043), a gene which plays a

role in the generation of heparan sulfate proteoglycan. Accordingly, utilities of VGAM81 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HS3ST2. The function of HS3ST2 has been established by previous studies. By searching an EST database for sequences related to the sulfotransferase domain of 3OST1, Shworak et al. (1999) identified partial cDNAs from the 3OST2, 3OST3A1 (OMIM Ref. No. 604057), and 3OST4 (OMIM Ref. No. 604059) genes. They used the partial cDNAs as probes and recovered additional clones corresponding to these genes and to 3OST3B1 (OMIM Ref. No. 604058). The 3OST2 gene encodes a predicted 367-amino acid protein that, like 3OST3A1 and 3OST3B1, is a predicted type II integral membrane protein. These 3 enzymes contain a positively charged N-terminal domain, a transmembrane domain, a region termed the SPLAG domain because it is rich in serine, proline, leucine, alanine, and glycine, and a C-terminal putative sulfotransferase domain. Although they share a similar regional structure, the only significant sequence homology between these 3OST proteins occurs in the sulfotransferase domains. Northern blot analysis revealed that the 3OST2 and 3OST4 genes were expressed predomi-

nantly in brain, while the 3OST3 gene exhibited more widespread expression. In a companion paper, Liu et al. (1999) demonstrated that the 3OST1, 3OST2, and 3OST3 isoforms each generate unique 3-O-sulfated structures. Shworak et al. (1999) stated that the isoforms with different sulfotransferase domains differentially place the rare 3-O-sulfate group in distinct sequence contexts, presumably to regulate discrete biologic activities. This capacity of the sulfotransferase domain to generate distinct sequences may in turn be modulated by the unique N-terminal domains of the proteins. By inclusion within mapped clones, Shworak et al. (1999) mapped the 3OST2 gene to 16p12, near the 3OST4 gene at 16p11.2. Using interspecific backcross analysis, they mapped the mouse 3Ost2 and 3Ost4 genes to the distal region of chromosome 7, in a region sharing homology of synteny with human chromosome 16p.

[2200] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[2201] Liu, J.; Shworak, N. W.; Sinay, P.; Schwartz, J. J.; Zhang, L.; Fritze, L. M.; Rosenberg, R. D. : Expression of heparan sulfate D-glucosaminyl 3-O-sulfotransferase isoforms re-

veals novel substrate specificities. J. Biol. Chem. 274: 5185–5192, 1999. ; and

[2202] Shworak, N. W.; Liu, J.; Petros, L. M.; Zhang, L.; Kobayashi, M.; Copeland, N. G.; Jenkins, N. A.; Rosenberg, R. D. : Multiple isoforms of heparan sulfate D–glucosaminyl 3–O–sulfotransf.

[2203] Further studies establishing the function and utilities of HS3ST2 are found in John Hopkins OMIM database record ID 604056, and in cited publications numbered 1148–1149 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Pim–2 Oncogene (PIM2, Accession XM_010208) is another VGAM81 host target gene. PIM2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PIM2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PIM2 BINDING SITE, designated SEQ ID:2550, to the nucleotide sequence of VGAM81 RNA, herein designated VGAM RNA, also designated SEQ ID:416.

[2204] Another function of VGAM81 is therefore inhibition of Pim–2 Oncogene (PIM2, Accession XM_010208). Accord–

ingly, utilities of VGAM81 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PIM2. Phosphatidylinositol-4-phosphate 5-kinase, Type I, Beta (PIP5K1B, Accession NM_003558) is another VGAM81 host target gene. PIP5K1B BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PIP5K1B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PIP5K1B BINDING SITE, designated SEQ ID:1034, to the nucleotide sequence of VGAM81 RNA, herein designated VGAM RNA, also designated SEQ ID:416.

[2205] Another function of VGAM81 is therefore inhibition of Phosphatidylinositol-4-phosphate 5-kinase, Type I, Beta (PIP5K1B, Accession NM_003558), a gene which catalyses the phosphorylation of phosphatidylinositol-4-phosphate to form phosphatidylinositol-4,5-bisphosphate. Accordingly, utilities of VGAM81 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PIP5K1B. The function of PIP5K1B has been established by previous studies. Carvajal et al. (1995) reported the isolation of a gene from the region of the

genome associated with Friedreich ataxia (FRDA; 229300). Expression was found to be complex, with multiple transcripts detected in a variety of tissues and evidence of alternative splicing and developmental control. The predicted amino acid sequence for the 2.7-kb transcript showed a marked homology to the deduced amino acid sequence of the MSS4 protein of *Saccharomyces cerevisiae*, which had been proposed to function in the phosphoinositide cycle, thus suggesting a potential role for the human homolog in signal transduction. Although no evidence of mutation was detected in the transcript, the sequence (which they designated STM7.I) represented only one of the shorter alternatively spliced species identified by Northern analysis and direct sequencing. Carvajal et al. (1996) reported that the X25 (frataxin-encoding) gene described by Campuzano et al. (1996) and shown to be associated with mutations in FRDA patients comprises part of a gene that they had previously identified and named STM7. They reported that the transcription of both STM7 and X25 occurs from the centromere toward the telomere, that the reported sequences of STM7 and X25 did not represent a full-length transcript, that multiple transcripts for each of these genes are present in Northern blots, and

that several of these transcripts are of similar size. Carvajal et al. (1996) also reported that less than 10 kb separates the CpG island identified in the X25/exon 1 from the 3-prime end of STM7/exon 16. They further demonstrated that the recombinant protein corresponding to the STM7.1 transcript has phosphatidylinositol-4-phosphate 5-kinase activity. See 606829 for further discussion of the relationship between STM7 and FRDA.

[2206] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[2207] Campuzano, V.; Montermini, L.; Molto, M. D.; Pianese, L.; Cossee, M.; Cavalcanti, F.; Monros, E.; Rodius, F.; Duclos, F.; Monticelli, A.; Zara, F.; Canizares, J.; Koutnikova, H.; Bidichandani, S. I.; Gellera, C.; Brice, A.; Trouillas, P.; De Michele, G.; Filla, A.; De Frutos, R.; Palau, F.; Patel, P. I.; Di Donato, S.; Mandel, J. -L.; Coccozza, S.; Koenig, M.; Pandolfo, M. : Friedreich's ataxia: autosomal recessive disease caused by an intronic GAA triplet repeat expansion. [2208] Carvajal, J. J.; Pook, M. A.; dos Santos, M.; Doudney, K.; Hillermann, R.; Minogue, S.; Williamson, R.; Hsuan, J. J.; Chamberlain, S. : The Friedreich's ataxia gene encodes a

novel phos.

[2209] Further studies establishing the function and utilities of PIP5K1B are found in John Hopkins OMIM database record ID 602745, and in cited publications numbered 1881–576 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. RNA Binding Motif Protein 3 (RBM3, Accession XM_047024) is another VGAM81 host target gene. RBM3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RBM3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RBM3 BINDING SITE, designated SEQ ID:2887, to the nucleotide sequence of VGAM81 RNA, herein designated VGAM RNA, also designated SEQ ID:416.

[2210] Another function of VGAM81 is therefore inhibition of RNA Binding Motif Protein 3 (RBM3, Accession XM_047024). Accordingly, utilities of VGAM81 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RBM3. SMAC (Accession NM_019887) is another VGAM81 host target gene. SMAC BINDING SITE1 through SMAC BINDING SITE3 are HOST

TARGET binding sites found in untranslated regions of mRNA encoded by SMAC, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SMAC BINDING SITE1 through SMAC BINDING SITE3, designated SEQ ID:1889, SEQ ID:2459 and SEQ ID:2460 respectively, to the nucleotide sequence of VGAM81 RNA, herein designated VGAM RNA, also designated SEQ ID:416.

[2211] Another function of VGAM81 is therefore inhibition of SMAC (Accession NM_019887), a gene which promotes apoptosis via caspase activation. Accordingly, utilities of VGAM81 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SMAC. The function of SMAC has been established by previous studies. Verhagen et al. (2000) identified the murine homolog of SMAC, which they called DIABLO (direct IAP-binding protein with low pI). They showed that DIABLO can bind mammalian IAP homolog A (MIHA, or API3) and can also interact with MIHB (API1; 601712), MIHC (API2; 601721), and OpiAP, the baculoviral IAP. Immunoprecipitation and Western blot analysis indicated that the N-terminally processed, IAP-interacting form of DIABLO is

concentrated in membrane fractions in healthy cells but is released into the MIHA-containing cytosolic fractions upon ultraviolet (UV) irradiation. Since transfection of cells with DIABLO was able to counter the protection afforded by MIHA against UV irradiation, the authors suggested that DIABLO may promote apoptosis by binding to IAPs and preventing them from inhibiting caspases. Chai et al. (2000) showed that SMAC/DIABLO promotes not only the proteolytic activation of procaspase-3, but also the enzymatic activity of mature caspase-3, both of which depend upon its ability to interact physically with IAPs. Animal model experiments lend further support to the function of SMAC. Okada et al. (2002) generated Diablo-deficient mice by homologous recombination. Western blot analysis confirmed the null mutation. The mice were fertile and appeared grossly normal at more than 1 year of age, and histologic analysis failed to detect any abnormalities. In vitro analysis indicated an inhibition of procaspase-3 (CASP3; 600636) cleavage in Diablo -/- cell lysates, but all types of Diablo -/- cells tested responded normally to a number of apoptotic stimuli. Fas (OMIM Ref. No. 134637)-mediated apoptosis in liver was also normal in vivo in these mice. The authors concluded that a redun-

dant molecule, possibly Omi (PRSS25; 606441), or molecules are capable of compensating for the loss of Diablo function. Alternatively, they suggested that Diablo may only regulate programmed cell death in specific situations or tissues not yet identified.

[2212] It is appreciated that the abovementioned animal model for SMAC is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[2213] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[2214] Okada, H.; Suh, W.-K.; Jin, J.; Woo, M.; Du, C.; Elia, A.; Duncan, G. S.; Wakeham, A.; Itie, A.; Lowe, S. W.; Wang, X.; Mak, T. W. : Generation and characterization of Smac/DIABLO-deficient mice. *Molec. Cell. Biol.* 22: 3509-3517, 2002. ; and

[2215] Verhagen, A. M.; Ekert, P. G.; Pakusch, M.; Silke, J.; Connolly, L. M.; Reid, G. E.; Moritz, R. L.; Simpson, R. J.; Vaux, D. L. : Identification of DIABLO, a mammalian protein that promote.

[2216] Further studies establishing the function and utilities of SMAC are found in John Hopkins OMIM database record ID

605219, and in cited publications numbered 1602–1603, 2065–1605, 206 and 1997 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Zinc Finger Protein 10 (KOX 1) (ZNF10, Accession NM_015394) is another VGAM81 host target gene. ZNF10 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by ZNF10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF10 BINDING SITE, designated SEQ ID:1626, to the nucleotide sequence of VGAM81 RNA, herein designated VGAM RNA, also designated SEQ ID:416.

[2217] Another function of VGAM81 is therefore inhibition of Zinc Finger Protein 10 (KOX 1) (ZNF10, Accession NM_015394), a gene which may function as a transcriptional regulator. Accordingly, utilities of VGAM81 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF10. The function of ZNF10 has been established by previous studies. In the course of mapping 27 nonoverlapping zinc finger cDNAs from human T cells by analysis of somatic cell hybrids, Huebner et al. (1991) mapped zinc finger protein–10 (KOX1) to 12q13–qter,

probably clustered with zinc finger protein-26 (OMIM Ref. No. 194537). Rousseau-Merck et al. (1993) also mapped the KOX1 (ZNF10) gene to 12q24.33 and demonstrated that it and KOX20 (ZNF26) are located within a pulsed field gel electrophoresis fragment less than 300 kb long. The mapping was done by a combination of somatic cell hybridization and in situ hybridization. Since ZNF26 has been mapped to 12q24.33 by in situ hybridization, this also must be the localization of ZNF10.

[2218] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[2219] Huebner, K.; Druck, T.; Croce, C. M.; Thiesen, H. J. : Twenty-seven nonoverlapping zinc finger cDNAs from human T cells map to nine different chromosomes with apparent clustering. *Am. J. Hum. Genet.* 48: 726-740, 1991. ; and

[2220] Rousseau-Merck, M.-F.; Hillion, J.; Jonveaux, P.; Couillin, P.; Seite, P.; Thiesen, H.-J.; Berger, R. : Chromosomal localization of 9 KOX zinc finger genes: physical linkages suggest cluste.

[2221] Further studies establishing the function and utilities of ZNF10 are found in John Hopkins OMIM database record

ID 194538, and in cited publications numbered 2268–2269 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. ATP-binding Cassette, Sub-family A (ABC1), Member 10 (ABCA10, Accession NM_080282) is another VGAM81 host target gene. ABCA10 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by ABCA10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ABCA10 BINDING SITE, designated SEQ ID:2373, to the nucleotide sequence of VGAM81 RNA, herein designated VGAM RNA, also designated SEQ ID:416.

[2222] Another function of VGAM81 is therefore inhibition of ATP-binding Cassette, Sub-family A (ABC1), Member 10 (ABCA10, Accession NM_080282). Accordingly, utilities of VGAM81 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ABCA10. H2A Histone Family, Member J (H2AFJ, Accession NM_018267) is another VGAM81 host target gene. H2AFJ BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by H2AFJ, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of H2AFJ BINDING SITE, designated SEQ ID:1807, to the nucleotide sequence of VGAM81 RNA, herein designated VGAM RNA, also designated SEQ ID:416.

[2223] Another function of VGAM81 is therefore inhibition of H2A Histone Family, Member J (H2AFJ, Accession NM_018267). Accordingly, utilities of VGAM81 include diagnosis, prevention and treatment of diseases and clinical conditions associated with H2AFJ. HSH2 (Accession NM_032855) is another VGAM81 host target gene. HSH2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HSH2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HSH2 BINDING SITE, designated SEQ ID:2289, to the nucleotide sequence of VGAM81 RNA, herein designated VGAM RNA, also designated SEQ ID:416.

[2224] Another function of VGAM81 is therefore inhibition of HSH2 (Accession NM_032855). Accordingly, utilities of VGAM81 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with HSH2. KIAA1024 (Accession XM_044580) is another VGAM81 host target gene. KIAA1024 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1024, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1024 BINDING SITE, designated SEQ ID:2841, to the nucleotide sequence of VGAM81 RNA, herein designated VGAM RNA, also designated SEQ ID:416.

[2225] Another function of VGAM81 is therefore inhibition of KIAA1024 (Accession XM_044580). Accordingly, utilities of VGAM81 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1024. KIAA1399 (Accession XM_046685) is another VGAM81 host target gene. KIAA1399 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1399, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1399 BINDING SITE, designated SEQ ID:2881, to the

nucleotide sequence of VGAM81 RNA, herein designated VGAM RNA, also designated SEQ ID:416.

[2226] Another function of VGAM81 is therefore inhibition of KIAA1399 (Accession XM_046685). Accordingly, utilities of VGAM81 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1399. MIC2 Like 1 (MIC2L1, Accession NM_031462) is another VGAM81 host target gene. MIC2L1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MIC2L1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MIC2L1 BINDING SITE, designated SEQ ID:2205, to the nucleotide sequence of VGAM81 RNA, herein designated VGAM RNA, also designated SEQ ID:416.

[2227] Another function of VGAM81 is therefore inhibition of MIC2 Like 1 (MIC2L1, Accession NM_031462). Accordingly, utilities of VGAM81 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MIC2L1. Ras Protein-specific Guanine Nucleotide-releasing Factor 2 (RASGRF2, Accession XM_027943) is another VGAM81 host target gene. RAS-

GRF2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RASGRF2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RASGRF2 BINDING SITE, designated SEQ ID:2590, to the nucleotide sequence of VGAM81 RNA, herein designated VGAM RNA, also designated SEQ ID:416.

[2228] Another function of VGAM81 is therefore inhibition of Ras Protein-specific Guanine Nucleotide-releasing Factor 2 (RASGRF2, Accession XM_027943). Accordingly, utilities of VGAM81 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RASGRF2. Tight Junction Protein 2 (zona occludens 2) (TJP2, Accession XM_005446) is another VGAM81 host target gene. TJP2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TJP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TJP2 BINDING SITE, designated SEQ ID:2534, to the nucleotide sequence of VGAM81 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:416.

[2229] Another function of VGAM81 is therefore inhibition of Tight Junction Protein 2 (zona occludens 2) (TJP2, Accession XM_005446). Accordingly, utilities of VGAM81 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TJP2. LOC202020 (Accession XM_114419) is another VGAM81 host target gene. LOC202020 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC202020, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC202020 BINDING SITE, designated SEQ ID:3459, to the nucleotide sequence of VGAM81 RNA, herein designated VGAM RNA, also designated SEQ ID:416.

[2230] Another function of VGAM81 is therefore inhibition of LOC220766 (Accession XM_165471). Accordingly, utilities of VGAM81 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220766. LOC220766 BINDING SITE is HOST TARGET binding site found in the 5' un-

translated region of mRNA encoded by LOC220766, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220766 BINDING SITE, designated SEQ ID:3499, to the nucleotide sequence of VGAM81 RNA, herein designated VGAM RNA, also designated SEQ ID:416.

[2231] Another function of VGAM81 is therefore inhibition of LOC220766 (Accession XM_165471). Accordingly, utilities of VGAM81 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220766. LOC256277 (Accession XM_170644) is another VGAM81 host target gene. LOC256277 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC256277, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256277 BINDING SITE, designated SEQ ID:3664, to the nucleotide sequence of VGAM81 RNA, herein designated VGAM RNA, also designated SEQ ID:416.

[2232] Another function of VGAM81 is therefore inhibition of LOC256277 (Accession XM_170644). Accordingly, utilities

of VGAM81 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256277. LOC256337 (Accession XM_170643) is another VGAM81 host target gene. LOC256337 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC256337, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256337 BINDING SITE, designated SEQ ID:3663, to the nucleotide sequence of VGAM81 RNA, herein designated VGAM RNA, also designated SEQ ID:416.

[2233] Another function of VGAM81 is therefore inhibition of LOC256337 (Accession XM_170643). Accordingly, utilities of VGAM81 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256337. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 82 (VGAM82) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[2234] VGAM82 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM82 was detected is described hereinabove with reference to Figs. 1–8.

[2235] VGAM82 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus. VGAM82 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[2236] VGAM82 gene encodes a VGAM82 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM82 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM82 precursor RNA is designated SEQ ID:68, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:68 is located at position 24541 relative to the genome of Vaccinia Virus.

[2237] VGAM82 precursor RNA folds onto itself, forming VGAM82 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is

due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[2238] An enzyme complex designated DICER COMPLEX, `dices` the VGAM82 folded precursor RNA into VGAM82 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 86%) nucleotide sequence of VGAM82 RNA is designated SEQ ID:417, and is provided hereinbelow with reference to the sequence listing part.

[2239] VGAM82 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM82 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM82 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[2240] VGAM82 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM82 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM82 RNA is an accurate or a partial inverted-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM82 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM82 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR and 5' UTR regions.

[2241] The complementary binding of VGAM82 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM82 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM82 host target RNA into VGAM82 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[2242] It is appreciated that VGAM82 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM82 host target genes. The mRNA of each one of this plurality of VGAM82 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM82 RNA, herein designated VGAM RNA, and which when bound by VGAM82 RNA causes inhibition of translation of respective one or more VGAM82 host target proteins.

[2243] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM82 gene, herein designated VGAM GENE, on one or more VGAM82 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with

reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[2244] It is yet further appreciated that a function of VGAM82 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM82 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM82 correlate with, and may be deduced from, the identity of the host target genes which VGAM82 binds and inhibits, and the function of these host target genes, as elaborated herein-below.

[2245] Nucleotide sequences of the VGAM82 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM82 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of

VGAM82 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM82 are further described hereinbelow with reference to Table 1.

[2246] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM82 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM82 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[2247] As mentioned hereinabove with reference to Fig. 1, a function of VGAM82 gene, herein designated VGAM is inhibition of expression of VGAM82 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM82 correlate with, and may be deduced from, the identity of the target genes which VGAM82 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[2248] PTCRA (Accession NM_138296) is a VGAM82 host target gene. PTCRA BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PTCRA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of PTCRA BINDING SITE, designated SEQ ID:2433, to the nucleotide sequence of VGAM82 RNA, herein designated VGAM RNA, also designated SEQ ID:417.

[2249] A function of VGAM82 is therefore inhibition of PTCRA (Accession NM_138296). Accordingly, utilities of VGAM82 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTCRA. Putative Neuronal Cell Adhesion Molecule (PUNC, Accession XM_116965) is another VGAM82 host target gene. PUNC BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PUNC, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PUNC BINDING SITE, designated SEQ ID:3469, to the nucleotide sequence of VGAM82 RNA, herein designated VGAM RNA, also designated SEQ ID:417.

[2250] Another function of VGAM82 is therefore inhibition of Putative Neuronal Cell Adhesion Molecule (PUNC, Accession XM_116965), a gene which is implicated as a tumor suppressor gene. Accordingly, utilities of VGAM82 include di-

agnosis, prevention and treatment of diseases and clinical conditions associated with PUNC. The function of PUNC has been established by previous studies. Mouse Punc is a transmembrane protein that belongs to the immunoglobulin (Ig) superfamily. With a domain configuration of 4 Ig domains and 2 fibronectin type III repeats, Punc represents a novel subclass within the Ig superfamily. Sequence comparisons revealed that Punc is related to Ig superfamily members that are either associated with axons or function in axon guidance. Punc is highly expressed in the nervous system and limb buds of the developing mouse embryo. At midgestation, expression levels of Punc decrease sharply. By PCR using oligonucleotides based on the mouse Punc sequence, Salbaum (1999) isolated a partial human placenta PUNC cDNA (GenBank AF063936). Animal model experiments lend further support to the function of PUNC. Yang et al. (2001) generated mice deficient in Punc. These mice were not overtly ataxic and coordination improved with practice. However, the motor abilities of Punc-deficient mice were significantly decreased compared with wildtype littermates, similar to the deficits observed in vimentin (VIM; 193060)-deficient mice. No hearing deficits were detected. Yang et al. (2001)

suggested that Punc expressed in Bergmann glia has a role in cerebellar control of motor coordination.

[2251] It is appreciated that the abovementioned animal model for PUNC is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[2252] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[2253] Salbaum, J. M. : Genomic structure and chromosomal localization of the mouse gene Punc. Mammalian Genome 10: 107–111, 1999. ; and

[2254] Yang, W.; Li, C.; Mansour, S. L. : Impaired motor coordination in mice that lack punc. Molec. Cell. Biol. 21: 6031–6043, 2001.

[2255] Further studies establishing the function and utilities of PUNC are found in John Hopkins OMIM database record ID 604184, and in cited publications numbered 220–221 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. KIAA0940 (Accession NM_014912) is another VGAM82 host target gene. KIAA0940 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded

by KIAA0940, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0940 BINDING SITE, designated SEQ ID:1586, to the nucleotide sequence of VGAM82 RNA, herein designated VGAM RNA, also designated SEQ ID:417.

[2256] Another function of VGAM82 is therefore inhibition of KIAA0940 (Accession NM_014912). Accordingly, utilities of VGAM82 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0940. Regulator of G-protein Signalling 18 (RGS18, Accession NM_130782) is another VGAM82 host target gene. RGS18 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RGS18, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RGS18 BINDING SITE, designated SEQ ID:2398, to the nucleotide sequence of VGAM82 RNA, herein designated VGAM RNA, also designated SEQ ID:417.

[2257] Another function of VGAM82 is therefore inhibition of

Regulator of G-protein Signalling 18 (RGS18, Accession NM_130782). Accordingly, utilities of VGAM82 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RGS18. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 83 (VGAM83) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[2258] VGAM83 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM83 was detected is described hereinabove with reference to Figs. 1–8.

[2259] VGAM83 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus. VGAM83 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[2260] VGAM83 gene encodes a VGAM83 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM83 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide se–

quence of VGAM83 precursor RNA is designated SEQ ID:69, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:69 is located at position 23600 relative to the genome of Vaccinia Virus.

[2261] VGAM83 precursor RNA folds onto itself, forming VGAM83 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[2262] An enzyme complex designated DICER COMPLEX, `dices` the VGAM83 folded precursor RNA into VGAM83 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of VGAM83 RNA is designated SEQ ID:418, and is

provided hereinbelow with reference to the sequence listing part.

[2263] VGAM83 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM83 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM83 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[2264] VGAM83 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM83 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM83 RNA is an accurate or a partial inverted-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM83 RNA,

herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM83 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR and 5' UTR regions.

[2265] The complementary binding of VGAM83 RNA, herein designated VGAM RNA, to host target binding sites on VGAM83 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM83 host target RNA into VGAM83 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[2266] It is appreciated that VGAM83 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM83 host target genes. The mRNA of each one of this plurality of VGAM83 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM83 RNA, herein designated VGAM

RNA, and which when bound by VGAM83 RNA causes inhibition of translation of respective one or more VGAM83 host target proteins.

[2267] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM83 gene, herein designated VGAM GENE, on one or more VGAM83 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[2268] It is yet further appreciated that a function of VGAM83 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM83 include diagnosis, prevention and

treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM83 correlate with, and may be deduced from, the identity of the host target genes which VGAM83 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[2269] Nucleotide sequences of the VGAM83 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM83 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM83 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM83 are further described hereinbelow with reference to Table 1.

[2270] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM83 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM83 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[2271] As mentioned hereinabove with reference to Fig. 1, a function of VGAM83 gene, herein designated VGAM is inhibition of expression of VGAM83 target genes. It is ap-

preciated that specific functions, and accordingly utilities, of VGAM83 correlate with, and may be deduced from, the identity of the target genes which VGAM83 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[2272] ATPase, H⁺/K⁺ Transporting, Nongastric, Alpha Polypeptide (ATP12A, Accession NM_001676) is a VGAM83 host target gene. ATP12A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ATP12A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATP12A BINDING SITE, designated SEQ ID:846, to the nucleotide sequence of VGAM83 RNA, herein designated VGAM RNA, also designated SEQ ID:418.

[2273] A function of VGAM83 is therefore inhibition of ATPase, H⁺/K⁺ Transporting, Nongastric, Alpha Polypeptide (ATP12A, Accession NM_001676). Accordingly, utilities of VGAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP12A. Crystallin, Gamma S (CRYGS, Accession NM_017541) is another VGAM83 host target gene. CRYGS BINDING SITE is

HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CRYGS, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CRYGS BINDING SITE, designated SEQ ID:1722, to the nucleotide sequence of VGAM83 RNA, herein designated VGAM RNA, also designated SEQ ID:418.

[2274] Another function of VGAM83 is therefore inhibition of Crystallin, Gamma S (CRYGS, Accession NM_017541), a gene which is a dominant structural components of the vertebrate eye lens. Accordingly, utilities of VGAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CRYGS. The function of CRYGS has been established by previous studies. The beta-crystallins and gamma-crystallins of the mammalian lens form a superfamily of related proteins which are apparently derived from a common ancestral gene; see CRYGA (OMIM Ref. No. 123660). An exceptional member of this superfamily is gamma-S (formerly beta-S). In contrast to the beta-crystallins which associate in various combinations to form low or high molecular weight aggregates, gamma-S is, like the other gamma-crystallins, a

monomeric protein. It was suggested by den Dunnen et al. (1985) that all members of the human gamma-crystallin gene family are located on chromosome 2. However, study of hamster-human somatic cell hybrids with a bovine cDNA probe for CRYGS led Wijnen et al. (1989) to the conclusion that this gene is located on human chromosome 3.

[2275] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[2276] den Dunnen, J. T.; Jongbloed, R. J. E.; Geurts van Kessel, A. H. M.; Schoenmakers, J. G. G. : Human lens gamma-crystallin sequences are located in the p12-qter region of chromosome 2. Hum. Genet. 70: 217-221, 1985. ; and

[2277] Wijnen, J. T.; Oldenburg, M.; Bloemendal, H.; Meera Khan, P. : GS(gamma-S)-crystallin (CRYGS) assignment to chromosome 3. (Abstract) Cytogenet. Cell Genet. 51: 1108 only, 1989.

[2278] Further studies establishing the function and utilities of CRYGS are found in John Hopkins OMIM database record ID 123730, and in cited publications numbered 2809 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Lipin 2 (LPIN2, Ac-

cession NM_014646) is another VGAM83 host target gene. LPIN2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LPIN2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LPIN2 BINDING SITE, designated SEQ ID:1514, to the nucleotide sequence of VGAM83 RNA, herein designated VGAM RNA, also designated SEQ ID:418.

[2279] Another function of VGAM83 is therefore inhibition of Lipin 2 (LPIN2, Accession NM_014646). Accordingly, utilities of VGAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LPIN2. KIAA1786 (Accession XM_038436) is another VGAM83 host target gene. KIAA1786 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1786, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1786 BINDING SITE, designated SEQ ID:2738, to the nucleotide sequence of VGAM83 RNA, herein designated VGAM RNA, also designated SEQ ID:418.

[2280] Another function of VGAM83 is therefore inhibition of KIAA1786 (Accession XM_038436). Accordingly, utilities of VGAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1786. LOC222008 (Accession XM_168361) is another VGAM83 host target gene. LOC222008 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC222008, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222008 BINDING SITE, designated SEQ ID:3629, to the nucleotide sequence of VGAM83 RNA, herein designated VGAM RNA, also designated SEQ ID:418.

[2281] Another function of VGAM83 is therefore inhibition of LOC222008 (Accession XM_168361). Accordingly, utilities of VGAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222008. LOC90639 (Accession XM_033092) is another VGAM83 host target gene. LOC90639 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC90639, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90639 BINDING SITE, designated SEQ ID:2663, to the nucleotide sequence of VGAM83 RNA, herein designated VGAM RNA, also designated SEQ ID:418.

[2282] Another function of VGAM83 is therefore inhibition of LOC90639 (Accession XM_033092). Accordingly, utilities of VGAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90639. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 84 (VGAM84) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[2283] VGAM84 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM84 was detected is described hereinabove with reference to Figs. 1–8.

[2284] VGAM84 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus. VGAM84 host target gene, herein designated VGAM HOST TARGET

GENE, is a human gene contained in the human genome.

[2285] VGAM84 gene encodes a VGAM84 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM84 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM84 precursor RNA is designated SEQ ID:70, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:70 is located at position 27761 relative to the genome of Vaccinia Virus.

[2286] VGAM84 precursor RNA folds onto itself, forming VGAM84 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[2287] An enzyme complex designated DICER COMPLEX, `dices` the VGAM84 folded precursor RNA into VGAM84 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of VGAM84 RNA is designated SEQ ID:419, and is provided hereinbelow with reference to the sequence listing part.

[2288] VGAM84 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM84 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM84 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[2289] VGAM84 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM84 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM84 RNA is an accurate or a partial inverted-reversed sequence of the nucleotide sequence of

each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM84 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM84 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR and 5' UTR regions.

[2290] The complementary binding of VGAM84 RNA, herein designated VGAM RNA, to host target binding sites on VGAM84 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM84 host target RNA into VGAM84 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[2291] It is appreciated that VGAM84 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM84 host target genes. The mRNA of each one of this plurality of VGAM84 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM84 RNA, herein designated VGAM RNA, and which when bound by VGAM84 RNA causes inhibition of translation of respective one or more VGAM84 host target proteins.

[2292] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM84 gene, herein designated VGAM GENE, on one or more VGAM84 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA

genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[2293] It is yet further appreciated that a function of VGAM84 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM84 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM84 correlate with, and may be deduced from, the identity of the host target genes which VGAM84 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[2294] Nucleotide sequences of the VGAM84 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM84 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM84 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM84 are further described hereinbelow with reference to Table 1.

[2295] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM84 host target RNA, and schematic representation of the complementarity of each of these

host target binding sites to VGAM84 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[2296] As mentioned hereinabove with reference to Fig. 1, a function of VGAM84 gene, herein designated VGAM is inhibition of expression of VGAM84 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM84 correlate with, and may be deduced from, the identity of the target genes which VGAM84 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[2297] Adaptor-related Protein Complex 1, Beta 1 Subunit (AP1B1, Accession NM_001127) is a VGAM84 host target gene. AP1B1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by AP1B1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AP1B1 BINDING SITE, designated SEQ ID:803, to the nucleotide sequence of VGAM84 RNA, herein designated VGAM RNA, also designated SEQ ID:419.

[2298] A function of VGAM84 is therefore inhibition of Adaptor-related Protein Complex 1, Beta 1 Subunit (AP1B1, Acces-

sion NM_001127), a gene which plays a role in protein sorting in the late-golgi/trans-golgi network (tgn) and/or endosomes. Accordingly, utilities of VGAM84 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AP1B1. The function of AP1B1 has been established by previous studies. A 140-kb homozygous deletion in 22q12 in a sporadic meningioma directed Peyrard et al. (1994) to the cloning and characterization of a new member of the human beta-adaptin gene family, which was named BAM22 for 'beta-adaptin-meningioma-chromosome 22.' The BAM22 gene was totally inactivated in the tumor with homozygous deletion. Northern blot analysis of 70 sporadic meningiomas showed specific loss of expression in 8 tumors, suggesting inactivation of BAM22. Based on this, Peyrard et al. (1994) suggested that BAM22 is a second chromosome 22 locus important in meningioma development and second in importance to the neurofibromatosis type 2 gene (NF2; 101000). The likelihood that multiple loci on chromosome 22 are involved in the oncogenesis of meningioma is suggested by the facts that monosomy 22 is observed in as many as 65% of tumors (Zankl and Zang, 1980); some meningiomas have chromosome 22 deletions

not encompassing the NF2 gene region and do not show mutations in the NF2 gene; and constitutional ring chromosome 22 has been observed in young patients with multiple tumors (Arinami et al., 1986; Petrella et al., 1993).

[2299] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[2300] Peyrard, M.; Pan, H.-Q.; Kedra, D.; Fransson, I.; Swahn, S.; Hartman, K.; Clifton, S. W.; Roe, B. A.; Dumanski, J. P. : Structure of the promoter and genomic organization of the human beta-prime-adaptin gene (BAM22) from chromosome 22q12. Genomics 36: 112-117, 1996. ; and

[2301] Zankl, H.; Zang, K. D. : Correlations between clinical and cytogenetical data in 180 human meningiomas. Cancer Genet. Cytogenet. 1: 351-356, 1980.

[2302] Further studies establishing the function and utilities of AP1B1 are found in John Hopkins OMIM database record ID 600157, and in cited publications numbered 170 and 3034-1711 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. IQ Motif Containing GTPase Activating Protein 1 (IQGAP1, Accession XM_044539) is another VGAM84 host target gene.

IQGAP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by IQGAP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IQGAP1 BINDING SITE, designated SEQ ID:2840, to the nucleotide sequence of VGAM84 RNA, herein designated VGAM RNA, also designated SEQ ID:419.

[2303] Another function of VGAM84 is therefore inhibition of IQ Motif Containing GTPase Activating Protein 1 (IQGAP1, Accession XM_044539), a gene which inhibits GTPase activity of ras family of GTP binding proteins Cdc42Hs and rac. Accordingly, utilities of VGAM84 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IQGAP1. The function of IQGAP1 has been established by previous studies. Sugimoto et al. (2001) demonstrated that IQGAP1, a negative regulator of cell-cell adhesion, is upregulated by gene amplification at 15q26 in 2 gastric cancer cell lines. Amplification at 15q26 had been found in various malignancies, including breast cancers, and FES (OMIM Ref. No. 190030) and/or IGF1R (OMIM Ref. No. 147370) had been identified as tar-

gets for gene amplification in breast cancer, melanoma, and pancreatic adenocarcinoma. In contrast, Sugimoto et al. (2001) found that both genes are located telomeric to the amplicon at 15q26 in the 2 gastric cancer cell lines they studied. Fukata et al. (2002) found that IQGAP1, an effector of RAC1 (OMIM Ref. No. 602048) and CDC42, interacts with CLIP170 (RSN; 179838). In Vero fibroblasts, IQGAP1 localized at the polarized leading edge. Expression of a C-terminal fragment of IQGAP1 that included the CLIP170-binding region delocalized GFP-CLIP170 from the tips of microtubules and altered the microtubule array. The authors found that activated RAC1/CDC42, IQGAP1, and CLIP170 form a tripartite complex. Furthermore, expression of an IQGAP1 mutant defective in RAC1/CDC42 binding induced multiple leading edges. These results indicated that RAC1/CDC42 marks special cortical spots where the IQGAP1 and CLIP170 complex is targeted, leading to a polarized microtubule array and cell polarization

[2304] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

maga, M.; Kuroda, S.; Matsuura, Y.; Iwamatsu, A.; Perez, F.; Kaibuchi, K. : Rac1 and Cdc42 capture microtubules through IQGAP1 and CLIP-170. Cell 109: 873–885, 2002.
; and

[2306] Hart, M. J.; Callow, M. G.; Souza, B.; Polakis, P. : IQGAP1, a calmodulin-binding protein with a rasGAP-related domain, is a potential effector for cdc42Hs. EMBO J. 15: 2997–3005, 1996.

[2307] Further studies establishing the function and utilities of IQGAP1 are found in John Hopkins OMIM database record ID 603379, and in cited publications numbered 38 and 1689–1691 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Phosphodiesterase 6A, CGMP-specific, Rod, Alpha (PDE6A, Accession NM_000440) is another VGAM84 host target gene. PDE6A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PDE6A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PDE6A BINDING SITE, designated SEQ ID:744, to the nucleotide sequence of VGAM84 RNA, herein designated VGAM RNA, also designated SEQ

ID:419.

[2308] Another function of VGAM84 is therefore inhibition of Phosphodiesterase 6A, CGMP-specific, Rod, Alpha (PDE6A, Accession NM_000440). Accordingly, utilities of VGAM84 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PDE6A. Phosphatase and Tensin Homolog (mutated in multiple advanced cancers 1) (PTEN, Accession NM_000314) is another VGAM84 host target gene. PTEN BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PTEN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PTEN BINDING SITE, designated SEQ ID:728, to the nucleotide sequence of VGAM84 RNA, herein designated VGAM RNA, also designated SEQ ID:419.

[2309] Another function of VGAM84 is therefore inhibition of Phosphatase and Tensin Homolog (mutated in multiple advanced cancers 1) (PTEN, Accession NM_000314). Accordingly, utilities of VGAM84 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTEN. SH3-domain GRB2-like 2 (SH3GL2,

Accession NM_003026) is another VGAM84 host target gene. SH3GL2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SH3GL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SH3GL2 BINDING SITE, designated SEQ ID:985, to the nucleotide sequence of VGAM84 RNA, herein designated VGAM RNA, also designated SEQ ID:419.

[2310] Another function of VGAM84 is therefore inhibition of SH3-domain GRB2-like 2 (SH3GL2, Accession NM_003026), a gene which plays a role in synaptic vesicle recycling, in particular in clathrin-mediated vesicle endocytosis. Accordingly, utilities of VGAM84 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SH3GL2. The function of SH3GL2 has been established by previous studies. Endophilin-1 is a presynaptic protein that binds to dynamin (see OMIM Ref. No. 602377), a GTPase that is implicated in endocytosis and recycling of synaptic vesicles. Schmidt et al. (1999) showed that endophilin-1 is essential for the formation of synaptic-like microvesicles from the plasma

membrane. Endophilin-1 exhibits lysophosphatidic acid acyltransferase (LPAAT) activity. Endophilin-1-mediated synaptic-like microvesicle formation requires the transfer of the unsaturated fatty acid arachidonate to lysophosphatidic acid, converting it to phosphatidic acid. A deletion mutant lacking the SH3 domain, through which endophilin-1 interacts with dynamin, still exhibits LPAAT activity but no longer mediates synaptic-like microvesicle formation. Schmidt et al. (1999) concluded that endophilin-1 may induce negative membrane curvature by converting an inverted cone-shaped lipid to a cone-shaped lipid in the cytoplasmic leaflet of the bilayer. Schmidt et al. (1999) proposed that through this action, endophilin-1 works with dynamin to mediate synaptic vesicle invagination from the plasma membrane and fission. By screening with C-terminal CIN85 (OMIM Ref. No. 300374) as bait, Soubeyran et al. (2002) identified endophilins A1, A2 (OMIM Ref. No. 601768), and A3 (OMIM Ref. No. 603362) as constitutive interactors, via their SH3 domains, with proline-rich sequences of CIN85. EGF (OMIM Ref. No. 131530) stimulation results in a complex of CBL, CIN85, endophilins, and EGF receptors. Confocal microscopy demonstrated a diffuse cytoplasmic distribu-

tion in resting cells and a colocalization with EGF receptors in endocytic vesicles after EGF stimulation. Analysis with dominant interfering forms of CIN85 suggested that CIN85 is dispensable for polyubiquitination of EGF receptors but that it may be critical for the regulation of receptor endocytosis and lysosomal degradation. Soubeyran et al. (2002) concluded that CIN85 has a role in the control of postmembrane events such as targeting receptors for degradation and regulation of gene transcription, possibly by binding to multiple adaptor proteins.

- [2314] Further studies establishing the function and utilities of

SH3GL2 are found in John Hopkins OMIM database record ID 604465, and in cited publications numbered 2029, 111 and 2510 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Chromosome 1 Open Reading Frame 16 (C1orf16, Accession NM_014837) is another VGAM84 host target gene. C1orf16 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C1orf16, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C1orf16 BINDING SITE, designated SEQ ID:1567, to the nucleotide sequence of VGAM84 RNA, herein designated VGAM RNA, also designated SEQ ID:419.

[2315] Another function of VGAM84 is therefore inhibition of Chromosome 1 Open Reading Frame 16 (C1orf16, Accession NM_014837). Accordingly, utilities of VGAM84 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C1orf16. DKFZp547A023 (Accession XM_052065) is another VGAM84 host target gene. DKFZp547A023 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region

of mRNA encoded by DKFZp547A023, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp547A023 BINDING SITE, designated SEQ ID:2956, to the nucleotide sequence of VGAM84 RNA, herein designated VGAM RNA, also designated SEQ ID:419.

[2316] Another function of VGAM84 is therefore inhibition of DKFZp547A023 (Accession XM_052065). Accordingly, utilities of VGAM84 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp547A023. FLJ11850 (Accession NM_022741) is another VGAM84 host target gene. FLJ11850 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ11850, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11850 BINDING SITE, designated SEQ ID:2001, to the nucleotide sequence of VGAM84 RNA, herein designated VGAM RNA, also designated SEQ ID:419.

[2317] Another function of VGAM84 is therefore inhibition of FLJ11850 (Accession NM_022741). Accordingly, utilities of

VGAM84 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11850. FLJ12888 (Accession NM_024945) is another VGAM84 host target gene. FLJ12888 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ12888, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12888 BINDING SITE, designated SEQ ID:2115, to the nucleotide sequence of VGAM84 RNA, herein designated VGAM RNA, also designated SEQ ID:419.

[2318] Another function of VGAM84 is therefore inhibition of FLJ12888 (Accession NM_024945). Accordingly, utilities of VGAM84 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12888. FLJ21596 (Accession NM_024823) is another VGAM84 host target gene. FLJ21596 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ21596, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21596 BINDING SITE,

designated SEQ ID:2092, to the nucleotide sequence of VGAM84 RNA, herein designated VGAM RNA, also designated SEQ ID:419.

[2319] Another function of VGAM84 is therefore inhibition of FLJ21596 (Accession NM_024823). Accordingly, utilities of VGAM84 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21596. KIAA1878 (Accession XM_166256) is another VGAM84 host target gene. KIAA1878 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1878, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1878 BINDING SITE, designated SEQ ID:3539, to the nucleotide sequence of VGAM84 RNA, herein designated VGAM RNA, also designated SEQ ID:419.

[2320] Another function of VGAM84 is therefore inhibition of KIAA1878 (Accession XM_166256). Accordingly, utilities of VGAM84 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1878. Neurexophilin 3 (NXPH3, Accession XM_037847) is another VGAM84 host target gene. NXPH3

BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NXPH3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NXPH3 BINDING SITE, designated SEQ ID:2728, to the nucleotide sequence of VGAM84 RNA, herein designated VGAM RNA, also designated SEQ ID:419.

[2321] Another function of VGAM84 is therefore inhibition of Neurexophilin 3 (NXPH3, Accession XM_037847). Accordingly, utilities of VGAM84 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NXPH3. Synovial Sarcoma Translocation Gene On Chromosome 18-like 1 (SS18L1, Accession XM_037202) is another VGAM84 host target gene. SS18L1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SS18L1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SS18L1 BINDING SITE, designated SEQ ID:2719, to the nucleotide sequence of VGAM84 RNA, herein designated VGAM RNA, also designated SEQ ID:419.

[2322] Another function of VGAM84 is therefore inhibition of Synovial Sarcoma Translocation Gene On Chromosome 18-like 1 (SS18L1, Accession XM_037202). Accordingly, utilities of VGAM84 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SS18L1. Synaptotagmin XIII (SYT13, Accession XM_167880) is another VGAM84 host target gene. SYT13 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SYT13, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SYT13 BINDING SITE, designated SEQ ID:3605, to the nucleotide sequence of VGAM84 RNA, herein designated VGAM RNA, also designated SEQ ID:419.

[2323] Another function of VGAM84 is therefore inhibition of Synaptotagmin XIII (SYT13, Accession XM_167880). Accordingly, utilities of VGAM84 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SYT13. LOC134301 (Accession XM_059705) is another VGAM84 host target gene. LOC134301 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC134301, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC134301 BINDING SITE, designated SEQ ID:3016, to the nucleotide sequence of VGAM84 RNA, herein designated VGAM RNA, also designated SEQ ID:419.

[2324] Another function of VGAM84 is therefore inhibition of LOC134301 (Accession XM_059705). Accordingly, utilities of VGAM84 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC134301. LOC151438 (Accession XM_098060) is another VGAM84 host target gene. LOC151438 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC151438, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151438 BINDING SITE, designated SEQ ID:3346, to the nucleotide sequence of VGAM84 RNA, herein designated VGAM RNA, also designated SEQ ID:419.

[2325] Another function of VGAM84 is therefore inhibition of LOC151438 (Accession XM_098060). Accordingly, utilities of VGAM84 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LOC151438. LOC158696 (Accession XM_088644) is another VGAM84 host target gene. LOC158696 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC158696, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158696 BINDING SITE, designated SEQ ID:3223, to the nucleotide sequence of VGAM84 RNA, herein designated VGAM RNA, also designated SEQ ID:419.

[2326] Another function of VGAM84 is therefore inhibition of LOC158696 (Accession XM_088644). Accordingly, utilities of VGAM84 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158696. LOC221975 (Accession XM_166534) is another VGAM84 host target gene. LOC221975 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC221975, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221975 BINDING SITE, designated SEQ ID:3570, to

the nucleotide sequence of VGAM84 RNA, herein designated VGAM RNA, also designated SEQ ID:419.

[2327] Another function of VGAM84 is therefore inhibition of LOC221975 (Accession XM_166534). Accordingly, utilities of VGAM84 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221975. LOC84549 (Accession NM_032509) is another VGAM84 host target gene. LOC84549 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC84549, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC84549 BINDING SITE, designated SEQ ID:2256, to the nucleotide sequence of VGAM84 RNA, herein designated VGAM RNA, also designated SEQ ID:419.

[2328] Another function of VGAM84 is therefore inhibition of LOC84549 (Accession NM_032509). Accordingly, utilities of VGAM84 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC84549. LOC90459 (Accession XM_031826) is another VGAM84 host target gene. LOC90459 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by LOC90459, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90459 BINDING SITE, designated SEQ ID:2644, to the nucleotide sequence of VGAM84 RNA, herein designated VGAM RNA, also designated SEQ ID:419.

[2329] Another function of VGAM84 is therefore inhibition of LOC90459 (Accession XM_031826). Accordingly, utilities of VGAM84 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90459. LOC90529 (Accession XM_032350) is another VGAM84 host target gene. LOC90529 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC90529, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90529 BINDING SITE, designated SEQ ID:2652, to the nucleotide sequence of VGAM84 RNA, herein designated VGAM RNA, also designated SEQ ID:419.

[2330] Another function of VGAM84 is therefore inhibition of LOC90529 (Accession XM_032350). Accordingly, utilities

of VGAM84 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90529. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 85 (VGAM85) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[2331] VGAM85 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM85 was detected is described hereinabove with reference to Figs. 1–8.

[2332] VGAM85 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus. VGAM85 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[2333] VGAM85 gene encodes a VGAM85 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM85 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM85 precursor RNA is designated SEQ

ID:71, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:71 is located at position 26098 relative to the genome of Vaccinia Virus.

[2334] VGAM85 precursor RNA folds onto itself, forming VGAM85 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[2335] An enzyme complex designated DICER COMPLEX, `dices` the VGAM85 folded precursor RNA into VGAM85 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 90%) nucleotide sequence of VGAM85 RNA is designated SEQ ID:420, and is provided hereinbelow with reference to the sequence list-

ing part.

[2336] VGAM85 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM85 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM85 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[2337] VGAM85 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM85 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM85 RNA is an accurate or a partial inverted-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM85 RNA, herein designated VGAM RNA, may have a different num-

ber of host target binding sites in untranslated regions of a VGAM85 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR and 5' UTR regions.

[2338] The complementary binding of VGAM85 RNA, herein designated VGAM RNA, to host target binding sites on VGAM85 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM85 host target RNA into VGAM85 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[2339] It is appreciated that VGAM85 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM85 host target genes. The mRNA of each one of this plurality of VGAM85 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM85 RNA, herein designated VGAM RNA, and which when bound by VGAM85 RNA causes in–

hibition of translation of respective one or more VGAM85 host target proteins.

[2340] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM85 gene, herein designated VGAM GENE, on one or more VGAM85 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[2341] It is yet further appreciated that a function of VGAM85 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM85 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific

functions, and accordingly utilities, of VGAM85 correlate with, and may be deduced from, the identity of the host target genes which VGAM85 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[2342] Nucleotide sequences of the VGAM85 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM85 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM85 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM85 are further described hereinbelow with reference to Table 1.

[2343] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM85 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM85 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[2344] As mentioned hereinabove with reference to Fig. 1, a function of VGAM85 gene, herein designated VGAM is inhibition of expression of VGAM85 target genes. It is appreciated that specific functions, and accordingly utilities,

of VGAM85 correlate with, and may be deduced from, the identity of the target genes which VGAM85 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[2345] Coagulation Factor II (thrombin) Receptor-like 3 (F2RL3, Accession NM_003950) is a VGAM85 host target gene. F2RL3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by F2RL3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of F2RL3 BINDING SITE, designated SEQ ID:1074, to the nucleotide sequence of VGAM85 RNA, herein designated VGAM RNA, also designated SEQ ID:420.

[2346] A function of VGAM85 is therefore inhibition of Coagulation Factor II (thrombin) Receptor-like 3 (F2RL3, Accession NM_003950), a gene which Protease-activated receptor 4; G protein-coupled receptor that increases phosphoinositide hydrolysis. Accordingly, utilities of VGAM85 include diagnosis, prevention and treatment of diseases and clinical conditions associated with F2RL3. The function of F2RL3 has been established by previous studies. Protease-activated receptors 1 (PAR1; 187930), 2 (PAR2;

600933), and 3 (PAR3; 601919) are members of a unique G protein–coupled receptor family. They are characterized by a tethered peptide ligand at the extracellular amino terminus that is generated by minor proteolysis. Xu et al. (1998) identified a partial cDNA sequence of a fourth member of this family, PAR4, in an expressed sequence tag (EST) database, and a full–length cDNA clone was isolated from a lymphoma Daudi cell cDNA library. The open reading frame coded for a 7–transmembrane domain protein of 385 amino acids with 33% amino acid sequence identity with PAR1–3. A putative protease cleavage site was identified within the extracellular amino terminus. Northern blot analysis showed that PAR4 mRNA is expressed in a number of human tissues, with high levels being present in lung, pancreas, thyroid, testis, and small intestine. By fluorescence in situ hybridization, Xu et al. (1998) mapped the PAR4 gene to 19p12. Animal model experiments lend further support to the function of F2RL3. Sambrano et al. (2001) demonstrated that platelets from Par4–deficient mice failed to change shape, mobilize calcium, secrete ATP, or aggregate in response to thrombin.

[2347] It is appreciated that the abovementioned animal model

for F2RL3 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[2348] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[2349] Xu, W.-F.; Andersen, H.; Whitmore, T. E.; Presnell, S. R.; Yee, D. P.; Ching, A.; Gilbert, T.; Davie, E. W.; Foster, D. C. : Cloning and characterization of human protease-activated receptor 4. Proc. Nat. Acad. Sci. 95: 6642-6646, 1998. ; and

[2350] Sambrano, G. R.; Weiss, E. J.; Zheng, Y.-W.; Huang, W.; Coughlin, S. R. : Role of thrombin signalling in platelets in haemostasis and thrombosis. Nature 413: 74-78, 2001.

[2351] Further studies establishing the function and utilities of F2RL3 are found in John Hopkins OMIM database record ID 602779, and in cited publications numbered 1755, 2132-213 and 1756 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. RAP1B, Member of RAS Oncogene Family (RAP1B, Accession NM_015646) is another VGAM85 host target gene. RAP1B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RAP1B,

corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAP1B BINDING SITE, designated SEQ ID:1642, to the nucleotide sequence of VGAM85 RNA, herein designated VGAM RNA, also designated SEQ ID:420.

[2352] Another function of VGAM85 is therefore inhibition of RAP1B, Member of RAS Oncogene Family (RAP1B, Accession NM_015646), a gene which induces morphological reversion of a cell line transformed by a ras oncogene. Accordingly, utilities of VGAM85 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAP1B. The function of RAP1B has been established by previous studies. Three human cDNAs encoding 'new' RAS-related proteins, designated RAP1A, RAP1B, and RAP2, were isolated by Pizon et al. (1988). These proteins share approximately 50% amino acid identity with the classical RAS proteins and have numerous structural features in common. The most striking difference between the RAP and RAS proteins resides in their 61st amino acid: glutamine in RAS is replaced by threonine in RAP proteins. Animal model experiments lend further support to the function of RAP1B. Using mice trans-

genic for constitutive expression of Rap1a within the T cell lineage, Sebzda et al. (2002) found that instead of anergy, these T cells showed enhanced T cell receptor-mediated responses, both in thymocytes and in mature T cells. In addition, Rap1a activation induces strong activation of beta-1 (OMIM Ref. No. 135630) and beta-2 (OMIM Ref. No. 600065) integrins. The authors concluded that Rap1a positively influences T cells by augmenting their responses and directing integrin activation.

[2353] It is appreciated that the abovementioned animal model for RAP1B is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[2354] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[2355] Pizon, V.; Chardin, P.; Lerosey, I.; Olofsson, B.; Tavitian, A. : Human cDNAs RAP1 and RAP2 homologous to the Drosophila gene Dras3 encode proteins closely related to ras in the 'effector' region. Oncogene 3: 201-204, 1988. ; and

[2356] Kitayama, H.; Sugimoto, Y.; Matsuzaki, T.; Ikawa, Y.; Noda, M. : A ras-related gene with transformation suppressor

activity. Cell 56: 77–84, 1989. PubMed ID : 2642744 9.

Sebzda, E.; Brac.

[2357] Further studies establishing the function and utilities of RAP1B are found in John Hopkins OMIM database record ID 179530, and in cited publications numbered listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Solute Carrier Family 6 (neurotransmitter transporter, betaine/GABA), Member 12 (SLC6A12, Accession NM_003044) is another VGAM85 host target gene. SLC6A12 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC6A12, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC6A12 BINDING SITE, designated SEQ ID:988, to the nucleotide sequence of VGAM85 RNA, herein designated VGAM RNA, also designated SEQ ID:420.

[2358] Another function of VGAM85 is therefore inhibition of Solute Carrier Family 6 (neurotransmitter transporter, betaine/GABA), Member 12 (SLC6A12, Accession NM_003044), a gene which transports betaine and gaba. Accordingly, utilities of VGAM85 include diagnosis, pre-

vention and treatment of diseases and clinical conditions associated with SLC6A12. The function of SLC6A12 has been established by previous studies. Yamauchi et al. (1992) stated that Madin–Darby canine kidney (MDCK) cells accumulate betaine when cultured in hypertonic media. They isolated an MDCK cell cDNA encoding a renal betaine transporter and designated it BGT1. When expressed in *Xenopus* oocytes, the BGT1 protein exhibited chloride- and sodium-dependent transport of both betaine and the neurotransmitter GABA. Northern blot analysis revealed that BGT1 expression is limited to the canine kidney medulla and is induced in MDCK cells by hypertonicity. Using the canine BGT1 sequence, Rasola et al. (1995) isolated a cDNA from a kidney library encoding the human homolog. The predicted 614-amino acid human protein has the typical structure of neurotransmitter transporters, with 12 transmembrane domains and a large extracellular loop between the third and fourth transmembrane domains. Northern blot analysis indicated that BGT1 is expressed as several mRNAs in human kidney and other tissues. Borden et al. (1995) also isolated human BGT1 cDNAs and reported that the human protein shares 91% and 87% sequence identity with canine and mouse

BGT1, respectively. Heterologous expression of human BGT1 in mammalian cells conferred high-affinity GABA uptake.

[2359] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[2360] Yamauchi, A.; Uchida, S.; Kwon, H. M.; Preston, A. S.; Robey, R. B.; Garcia-Perez, A.; Burg, M. B.; Handler, J. S. : Cloning of a Na(+) and Cl(-)-dependent betaine transporter that is regulated by hypertonicity. J. Biol. Chem. 267: 649-652, 1992. ; and

[2362] Further studies establishing the function and utilities of SLC6A12 are found in John Hopkins OMIM database record ID 603080, and in cited publications numbered 238-240 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Aldehyde Dehydrogenase 5 Family, Member A1 (succinate-semialdehyde dehydrogenase) (ALDH5A1, Accession NM_001080) is another VGAM85 host target gene.

ALDH5A1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ALDH5A1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ALDH5A1 BINDING SITE, designated SEQ ID:799, to the nucleotide sequence of VGAM85 RNA, herein designated VGAM RNA, also designated SEQ ID:420.

[2363] Another function of VGAM85 is therefore inhibition of Aldehyde Dehydrogenase 5 Family, Member A1 (succinate-semialdehyde dehydrogenase) (ALDH5A1, Accession NM_001080). Accordingly, utilities of VGAM85 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ALDH5A1. Chromosome 20 Open Reading Frame 112 (C20orf112, Accession NM_080616) is another VGAM85 host target gene. C20orf112 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C20orf112, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C20orf112 BINDING SITE, designated SEQ

ID:2379, to the nucleotide sequence of VGAM85 RNA, herein designated VGAM RNA, also designated SEQ ID:420.

[2364] Another function of VGAM85 is therefore inhibition of Chromosome 20 Open Reading Frame 112 (C20orf112, Accession NM_080616). Accordingly, utilities of VGAM85 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf112. Dicer1, Dcr-1 Homolog (Drosophila) (DICER1, Accession NM_030621) is another VGAM85 host target gene. DICER1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DICER1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DICER1 BINDING SITE, designated SEQ ID:2152, to the nucleotide sequence of VGAM85 RNA, herein designated VGAM RNA, also designated SEQ ID:420.

[2365] Another function of VGAM85 is therefore inhibition of Dicer1, Dcr-1 Homolog (Drosophila) (DICER1, Accession NM_030621). Accordingly, utilities of VGAM85 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DICER1. DKFZP566G1424

(Accession XM_097771) is another VGAM85 host target gene. DKFZP566G1424 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by DKFZP566G1424, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP566G1424 BINDING SITE, designated SEQ ID:3320, to the nucleotide sequence of VGAM85 RNA, herein designated VGAM RNA, also designated SEQ ID:420.

[2366] Another function of VGAM85 is therefore inhibition of DKFZP566G1424 (Accession XM_097771). Accordingly, utilities of VGAM85 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP566G1424. FLJ10858 (Accession NM_018248) is another VGAM85 host target gene. FLJ10858 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ10858, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10858 BINDING SITE, designated SEQ ID:1805, to the nucleotide sequence of VGAM85 RNA, herein designated VGAM RNA,

also designated SEQ ID:420.

[2367] Another function of VGAM85 is therefore inhibition of FLJ10858 (Accession NM_018248). Accordingly, utilities of VGAM85 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10858. FLJ13265 (Accession NM_024877) is another VGAM85 host target gene. FLJ13265 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ13265, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13265 BINDING SITE, designated SEQ ID:2100, to the nucleotide sequence of VGAM85 RNA, herein designated VGAM RNA, also designated SEQ ID:420.

[2368] Another function of VGAM85 is therefore inhibition of FLJ13265 (Accession NM_024877). Accordingly, utilities of VGAM85 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13265. FLJ22282 (Accession NM_024792) is another VGAM85 host target gene. FLJ22282 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ22282, corresponding to a HOST TARGET

binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22282 BINDING SITE, designated SEQ ID:2089, to the nucleotide sequence of VGAM85 RNA, herein designated VGAM RNA, also designated SEQ ID:420.

[2369] Another function of VGAM85 is therefore inhibition of FLJ22282 (Accession NM_024792). Accordingly, utilities of VGAM85 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22282. GBTS1 (Accession NM_145173) is another VGAM85 host target gene. GBTS1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GBTS1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GBTS1 BINDING SITE, designated SEQ ID:2516, to the nucleotide sequence of VGAM85 RNA, herein designated VGAM RNA, also designated SEQ ID:420.

[2370] Another function of VGAM85 is therefore inhibition of GBTS1 (Accession NM_145173). Accordingly, utilities of VGAM85 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with GBTS1.

KIAA0193 (Accession NM_014766) is another VGAM85 host target gene. KIAA0193 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0193, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0193 BINDING SITE, designated SEQ ID:1545, to the nucleotide sequence of VGAM85 RNA, herein designated VGAM RNA, also designated SEQ ID:420.

[2371] Another function of VGAM85 is therefore inhibition of KIAA0193 (Accession NM_014766). Accordingly, utilities of VGAM85 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0193. KIAA1030 (Accession XM_167789) is another VGAM85 host target gene. KIAA1030 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1030, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1030 BINDING SITE, designated SEQ ID:3597, to the

nucleotide sequence of VGAM85 RNA, herein designated VGAM RNA, also designated SEQ ID:420.

[2372] Another function of VGAM85 is therefore inhibition of KIAA1030 (Accession XM_167789). Accordingly, utilities of VGAM85 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1030. Olfactory Receptor, Family 7, Subfamily C, Member 1 (OR7C1, Accession NM_017506) is another VGAM85 host target gene. OR7C1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by OR7C1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OR7C1 BINDING SITE, designated SEQ ID:1719, to the nucleotide sequence of VGAM85 RNA, herein designated VGAM RNA, also designated SEQ ID:420.

[2373] Another function of VGAM85 is therefore inhibition of Olfactory Receptor, Family 7, Subfamily C, Member 1 (OR7C1, Accession NM_017506). Accordingly, utilities of VGAM85 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OR7C1. PRO2214 (Accession NM_018517) is another VGAM85

host target gene. PRO2214 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PRO2214, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO2214 BINDING SITE, designated SEQ ID:1834, to the nucleotide sequence of VGAM85 RNA, herein designated VGAM RNA, also designated SEQ ID:420.

[2374] Another function of VGAM85 is therefore inhibition of PRO2214 (Accession NM_018517). Accordingly, utilities of VGAM85 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO2214. Smith–Magenis Syndrome Chromosome Region, Candidate 5 (SMCR5, Accession NM_144774) is another VGAM85 host target gene. SMCR5 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SMCR5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SMCR5 BINDING SITE, designated SEQ ID:2502, to the nucleotide sequence of VGAM85 RNA, herein designated VGAM RNA, also desig–

nated SEQ ID:420.

[2375] Another function of VGAM85 is therefore inhibition of Smith–Magenis Syndrome Chromosome Region, Candidate 5 (SMCR5, Accession NM_144774). Accordingly, utilities of VGAM85 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SMCR5. SSH1 (Accession NM_018984) is another VGAM85 host target gene. SSH1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SSH1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SSH1 BINDING SITE, designated SEQ ID:1869, to the nucleotide sequence of VGAM85 RNA, herein designated VGAM RNA, also designated SEQ ID:420.

[2376] Another function of VGAM85 is therefore inhibition of SSH1 (Accession NM_018984). Accordingly, utilities of VGAM85 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SSH1. TERA (Accession NM_021238) is another VGAM85 host target gene. TERA BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TERA, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TERA BINDING SITE, designated SEQ ID:1948, to the nucleotide sequence of VGAM85 RNA, herein designated VGAM RNA, also designated SEQ ID:420.

[2377] Another function of VGAM85 is therefore inhibition of TERA (Accession NM_021238). Accordingly, utilities of VGAM85 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TERA. Williams–Beuren Syndrome Chromosome Region 23 (WBSCR23, Accession NM_025042) is another VGAM85 host target gene. WBSCR23 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by WBSCR23, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of WBSCR23 BINDING SITE, designated SEQ ID:2131, to the nucleotide sequence of VGAM85 RNA, herein designated VGAM RNA, also designated SEQ ID:420.

[2378] Another function of VGAM85 is therefore inhibition of Williams–Beuren Syndrome Chromosome Region 23

(WBSCR23, Accession NM_025042). Accordingly, utilities of VGAM85 include diagnosis, prevention and treatment of diseases and clinical conditions associated with WBSCR23. LOC134637 (Accession XM_059727) is another VGAM85 host target gene. LOC134637 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC134637, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC134637 BINDING SITE, designated SEQ ID:3017, to the nucleotide sequence of VGAM85 RNA, herein designated VGAM RNA, also designated SEQ ID:420.

[2379] Another function of VGAM85 is therefore inhibition of LOC134637 (Accession XM_059727). Accordingly, utilities of VGAM85 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC134637. LOC146745 (Accession XM_085577) is another VGAM85 host target gene. LOC146745 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC146745, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC146745 BINDING SITE, designated SEQ ID:3098, to the nucleotide sequence of VGAM85 RNA, herein designated VGAM RNA, also designated SEQ ID:420.

[2380] Another function of VGAM85 is therefore inhibition of LOC146745 (Accession XM_085577). Accordingly, utilities of VGAM85 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146745. LOC153416 (Accession XM_018473) is another VGAM85 host target gene. LOC153416 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC153416, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC153416 BINDING SITE, designated SEQ ID:2573, to the nucleotide sequence of VGAM85 RNA, herein designated VGAM RNA, also designated SEQ ID:420.

[2381] Another function of VGAM85 is therefore inhibition of LOC153416 (Accession XM_018473). Accordingly, utilities of VGAM85 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153416. LOC157867 (Accession XM_098831) is an-

other VGAM85 host target gene. LOC157867 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC157867, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157867 BINDING SITE, designated SEQ ID:3383, to the nucleotide sequence of VGAM85 RNA, herein designated VGAM RNA, also designated SEQ ID:420.

[2382] Another function of VGAM85 is therefore inhibition of LOC157867 (Accession XM_098831). Accordingly, utilities of VGAM85 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157867. LOC201243 (Accession XM_113935) is another VGAM85 host target gene. LOC201243 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC201243, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC201243 BINDING SITE, designated SEQ ID:3425, to the nucleotide sequence of VGAM85 RNA, herein designated VGAM RNA, also designated SEQ ID:420.

[2383] Another function of VGAM85 is therefore inhibition of LOC201243 (Accession XM_113935). Accordingly, utilities of VGAM85 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201243. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 86 (VGAM86) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[2384] VGAM86 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM86 was detected is described hereinabove with reference to Figs. 1–8.

[2385] VGAM86 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus. VGAM86 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[2386] VGAM86 gene encodes a VGAM86 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM86 precursor RNA does not encode a protein. A nucleotide

sequence identical or highly similar to the nucleotide sequence of VGAM86 precursor RNA is designated SEQ ID:72, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:72 is located at position 25950 relative to the genome of Vaccinia Virus.

[2387] VGAM86 precursor RNA folds onto itself, forming VGAM86 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[2388] An enzyme complex designated DICER COMPLEX, `dices` the VGAM86 folded precursor RNA into VGAM86 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 89%) nucleotide se-

quence of VGAM86 RNA is designated SEQ ID:421, and is provided hereinbelow with reference to the sequence listing part.

[2389] VGAM86 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM86 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM86 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[2390] VGAM86 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM86 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM86 RNA is an accurate or a partial inverted-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustra-

tion only, and is not meant to be limiting – VGAM86 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM86 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[2391] The complementary binding of VGAM86 RNA, herein designated VGAM RNA, to host target binding sites on VGAM86 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM86 host target RNA into VGAM86 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[2392] It is appreciated that VGAM86 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM86 host target genes. The mRNA of each one of this plurality of VGAM86 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM86 RNA, herein designated VGAM RNA, and which when bound by VGAM86 RNA causes inhibition of translation of respective one or more VGAM86 host target proteins.

- [2393] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM86 gene, herein designated VGAM GENE, on one or more VGAM86 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).
- [2394] It is yet further appreciated that a function of VGAM86 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM86 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM86 correlate with, and may be deduced from, the identity of the host target genes which VGAM86 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[2395] Nucleotide sequences of the VGAM86 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM86 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM86 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM86 are further described hereinbelow with reference to Table 1.

[2396] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM86 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM86 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[2397] As mentioned hereinabove with reference to Fig. 1, a function of VGAM86 gene, herein designated VGAM is in-

hibition of expression of VGAM86 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM86 correlate with, and may be deduced from, the identity of the target genes which VGAM86 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[2398] Oxidative-stress Responsive 1 (OSR1, Accession NM_005109) is a VGAM86 host target gene. OSR1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by OSR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OSR1 BINDING SITE, designated SEQ ID:1188, to the nucleotide sequence of VGAM86 RNA, herein designated VGAM RNA, also designated SEQ ID:421.

[2399] A function of VGAM86 is therefore inhibition of Oxidative-stress Responsive 1 (OSR1, Accession NM_005109), a gene which mediates stress-activated signals. Accordingly, utilities of VGAM86 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OSR1. The function of OSR1 has been established by previous studies. The 3p22-p21.3 chromosomal region is

one of 3 regions of 3p that is commonly deleted in various carcinomas. By analyzing a cloned segment from this region, Tamari et al. (1999) identified a novel gene that they designated OSR1 (oxidative stress-responsive-1) because the predicted 527-amino acid protein shares 39% identity with Ste20/oxidant stress-response kinase-1 (OMIM Ref. No. 602255). The OSR1 gene contains 18 exons and spans approximately 90 kb. Northern blot analysis revealed that OSR1 was expressed as a 4.6-kb major transcript in all tissues tested. A less abundant 7.5-kb mRNA was detected in heart and skeletal muscle. Daigo et al. (1999) reported that the OSR1 gene is located between the OCTL1 (OMIM Ref. No. 604047) and MYD88 (OMIM Ref. No. 602170) genes on 3p22-p21.3.

[2400] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[2401] Tamari, M.; Daigo, Y.; Nakamura, Y. : Isolation and characterization of a novel serine threonine kinase gene on chromosome 3q22-21.3. J. Hum. Genet. 44: 116-120, 1999. ; and

[2402] Daigo, Y.; Isomura, M.; Nishiwaki, T.; Tamari, M.; Ishikawa, S.; Kai, M.; Murata, Y.; Takeuchi, K.; Yamane, Y.;

Hayashi, R.; Minami, M.; Fujino, M. A.; Hojo, Y.; Uchiyama, I.; Takagi, T.;

[2403] Further studies establishing the function and utilities of OSR1 are found in John Hopkins OMIM database record ID 604046, and in cited publications numbered 2027 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Paired Basic Amino Acid Cleaving System 4 (PACE4, Accession NM_138325) is another VGAM86 host target gene. PACE4 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PACE4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PACE4 BINDING SITE, designated SEQ ID:2435, to the nucleotide sequence of VGAM86 RNA, herein designated VGAM RNA, also designated SEQ ID:421.

[2404] Another function of VGAM86 is therefore inhibition of Paired Basic Amino Acid Cleaving System 4 (PACE4, Accession NM_138325), a gene which processes hormone precursors by cleaving paired basic amino acids. Accordingly, utilities of VGAM86 include diagnosis, prevention and treatment of diseases and clinical conditions associated

with PACE4. The function of PACE4 has been established by previous studies. Using PCR methods, Kiefer et al. (1991) identified a second human subtilisin-like protease gene on chromosome 15. PCR primers were designed to be specific for the subfamily of eukaryotic subtilisin-like proteases with specificity for paired basic amino acid residue processing motifs. The gene encoding this protease, designated PACE4, also encoded a smaller subtilisin-related polypeptide derived by alternative mRNA splicing. As with the product of the PACE gene (OMIM Ref. No. 136950), the tissue distribution of PACE4 was widespread, with comparatively higher levels in the liver. By in situ hybridization using isolated cosmid clones, Kiefer et al. (1991) mapped the PACE4 gene to chromosome 15 in close proximity to the PACE gene at 15q25-q26. Double labeling in situ hybridization suggested that the 2 genes are within 5 megabases of each other. Mbikay et al. (1995) mapped the gene for PACE4 (Pcsk6) to mouse chromosome 7 by RFLP analysis of a DNA panel from an interspecific backcross. It was located at a distance of 13 cM from the Pcsk3 locus, which specifies furin (OMIM Ref. No. 136950), another member of this family of enzymes previously mapped to mouse chromo-

some 7. This is in concordance with the known close proximity of these 2 loci in the homologous region on human 15q25-qter. Pcsk3 and Pcsk6 map to a region of mouse chromosome 7 that has been associated cytogenetically with postnatal lethality in maternal disomy, suggesting that these genes may be imprinted.

[2405] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[2406] Kiefer, M. C.; Tucker, J. E.; Joh, R.; Landsberg, K. E.; Saltman, D.; Barr, P. J. : Identification of a second human subtilisin-like protease gene in the fes/fps region of chromosome 15. DNA Cell Biol. 10: 757-769, 1991. ; and

[2407] Mbikay, M.; Seidah, N. G.; Chretien, M.; Simpson, E. M. : Chromosomal assignment of the genes for proprotein convertases PC4, PC5, and PACE 4 in mouse and human. Genomics 26: 123-129, 19.

[2408] Further studies establishing the function and utilities of PACE4 are found in John Hopkins OMIM database record ID 167405, and in cited publications numbered 2365 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. KIAA1462 (Accession XM_166132) is another VGAM86 host target

gene. KIAA1462 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1462, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1462 BINDING SITE, designated SEQ ID:3522, to the nucleotide sequence of VGAM86 RNA, herein designated VGAM RNA, also designated SEQ ID:421.

[2409] Another function of VGAM86 is therefore inhibition of KIAA1462 (Accession XM_166132). Accordingly, utilities of VGAM86 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1462. LOC145945 (Accession XM_096908) is another VGAM86 host target gene. LOC145945 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC145945, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145945 BINDING SITE, designated SEQ ID:3280, to the nucleotide sequence of VGAM86 RNA, herein designated VGAM RNA, also designated SEQ ID:421.

[2410] Another function of VGAM86 is therefore inhibition of LOC145945 (Accession XM_096908). Accordingly, utilities of VGAM86 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145945. LOC219401 (Accession XM_166706) is another VGAM86 host target gene. LOC219401 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC219401, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219401 BINDING SITE, designated SEQ ID:3580, to the nucleotide sequence of VGAM86 RNA, herein designated VGAM RNA, also designated SEQ ID:421.

[2411] Another function of VGAM86 is therefore inhibition of LOC219401 (Accession XM_166706). Accordingly, utilities of VGAM86 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219401. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 87 (VGAM87) viral gene, which modulates expression of respective host target genes thereof,

the function and utility of which host target genes is known in the art.

[2412] VGAM87 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM87 was detected is described hereinabove with reference to Figs. 1–8.

[2413] VGAM87 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus. VGAM87 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[2414] VGAM87 gene encodes a VGAM87 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM87 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM87 precursor RNA is designated SEQ ID:73, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:73 is located at position 28644 relative to the genome of Vaccinia Virus.

[2415] VGAM87 precursor RNA folds onto itself, forming VGAM87 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[2416] An enzyme complex designated DICER COMPLEX, `dices` the VGAM87 folded precursor RNA into VGAM87 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 72%) nucleotide sequence of VGAM87 RNA is designated SEQ ID:422, and is provided hereinbelow with reference to the sequence listing part.

[2417] VGAM87 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM87 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM87 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3`

untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[2418] VGAM87 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM87 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM87 RNA is an accurate or a partial inverted-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM87 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM87 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[2419] The complementary binding of VGAM87 RNA, herein designated VGAM RNA, to host target binding sites on VGAM87 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM87 host target RNA into VGAM87 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[2420] It is appreciated that VGAM87 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM87 host target genes. The mRNA of each one of this plurality of VGAM87 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM87 RNA, herein designated VGAM RNA, and which when bound by VGAM87 RNA causes inhibition of translation of respective one or more VGAM87 host target proteins.

[2421] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM87 gene, herein designated VGAM GENE, on one or more VGAM87 host target gene, herein designated VGAM

HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[2422] It is yet further appreciated that a function of VGAM87 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM87 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM87 correlate with, and may be deduced from, the identity of the host target genes which VGAM87 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[2423] Nucleotide sequences of the VGAM87 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

`diced` VGAM87 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM87 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM87 are further described hereinbelow with reference to Table 1.

[2424] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM87 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM87 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[2425] As mentioned hereinabove with reference to Fig. 1, a function of VGAM87 gene, herein designated VGAM is inhibition of expression of VGAM87 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM87 correlate with, and may be deduced from, the identity of the target genes which VGAM87 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[2426] ATP-binding Cassette, Sub-family A (ABC1), Member 1 (ABCA1, Accession NM_005502) is a VGAM87 host target gene. ABCA1 BINDING SITE is HOST TARGET binding site

found in the 3' untranslated region of mRNA encoded by ABCA1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ABCA1 BINDING SITE, designated SEQ ID:1219, to the nucleotide sequence of VGAM87 RNA, herein designated VGAM RNA, also designated SEQ ID:422.

[2427] A function of VGAM87 is therefore inhibition of ATP-binding Cassette, Sub-family A (ABC1), Member 1 (ABCA1, Accession NM_005502), a gene which camp-dependent and sulfonylurea-sensitive anion transporter. Accordingly, utilities of VGAM87 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ABCA1. The function of ABCA1 has been established by previous studies. By a PCR-based approach, Luciani et al. (1994) identified 2 novel mammalian members of the family of ATP-binding cassette (ABC) transporters designated ABC1 and ABC2 (OMIM Ref. No. 600047). They belong to a group of traffic ATPases encoded as a single multifunctional protein, such as CFTR (OMIM Ref. No. 602421) and P-glycoproteins (see OMIM Ref. No. 171050). Both ABC1 and ABC2 are large, internally sym-

metrical molecules that contain complete information for a functional 'channel-like' structure, a feature typical of the mammalian transporters at the plasma membrane. In both ABC1 and ABC2, the 2 halves of the molecules do not share extensive sequence similarity, apart from the nucleotide binding domains. This feature, shared with CFTR and with MRP1 (OMIM Ref. No. 158343), is in contrast with the high similarity shown by the 2 halves of P-glycoproteins. The finding argues against internal gene duplication as the event giving rise to the symmetric structure and favors the alternative hypothesis of the fusion of 2 independently evolved genes encoding the 2 halves. Santamarina-Fojo et al. (2000) found that the ABCA1 gene spans 149 kb and contains 50 exons. They identified 62 repetitive Alu sequences in the 49 introns. Comparative analysis of the mouse and human ABCA1 promoter sequences identified specific regulatory elements that are evolutionarily conserved. Pullinger et al. (2000) analyzed the promoter region of ABCA1. They identified 7 putative SP1 (OMIM Ref. No. 189906)-binding sites, 4 sterol regulatory elements (SREs) similar to the SRE of the low density lipoprotein receptor (LDLR; 606945) promoter region, a CpG island, a possible weak TATA box,

2 distal CCAAT sequences, and binding sites for several other transcription factors.

[2428] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[2429] Luciani, M. F.; Denizot, F.; Savary, S.; Mattei, M. G.; Chimini, G. : Cloning of two novel ABC transporters mapping on human chromosome 9. *Genomics* 21: 150–159, 1994.
; and

[2430] Santamarina-Fojo, S.; Peterson, K.; Knapper, C.; Qiu, Y.; Freeman, L.; Cheng, J.-F.; Osorio, J.; Remaley, A.; Yang, X.-P.; Haudenschild, C.; Prades, C.; Chimini, G.; Blackmon, E.; Franc.

[2431] Further studies establishing the function and utilities of ABCA1 are found in John Hopkins OMIM database record ID 600046, and in cited publications numbered 2331–2157, 2332, 2333–2334, 1662, 2335–2339, 2346, 2341–2343, 2347, 2349, 2159–1759, 263 and 2160–1762 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. CD2-associated Protein (CD2AP, Accession NM_012120) is another VGAM87 host target gene. CD2AP BINDING SITE is HOST TARGET binding site found in the

3' untranslated region of mRNA encoded by CD2AP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CD2AP BINDING SITE, designated SEQ ID:1408, to the nucleotide sequence of VGAM87 RNA, herein designated VGAM RNA, also designated SEQ ID:422.

[2432] Another function of VGAM87 is therefore inhibition of CD2-associated Protein (CD2AP, Accession NM_012120), a gene which binds CAS ligand and may therefore involve in its growth regulatory pathway. Accordingly, utilities of VGAM87 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CD2AP. The function of CD2AP has been established by previous studies. P130(Cas) (OMIM Ref. No. 602941) is a docking protein that is tyrosine-phosphorylated in response to a variety of extracellular stimuli, such as growth factors, cell-cell interaction, and cell-matrix interaction, and appears to play a critical role in the integrin-linked formation of focal complexes. To understand the growth regulatory pathway of p130(Cas), Kirsch et al. (1999) used the yeast 2-hybrid system to search for interacting molecules. They identified a human protein, which they called CMS

for p130(Cas) ligand with multiple SH3 domains, as a direct binding protein of p130(Cas). CMS is a multifunctional adapter-type molecule, which is localized in the cytoplasm, membrane ruffles, and leading edges of cells. Its structure and colocalization with F-actin (see OMIM Ref. No. 102610) and p130(Cas) suggested a function as a scaffolding protein involved in the dynamic regulation of the actin cytoskeleton. The cDNA corresponding to CMS encodes a protein of 639 amino acids with a deduced molecular mass of approximately 70 kD. Amino acid analysis revealed that CMS contains in its N terminus 3 SH3 domains followed by a proline-rich region containing binding sites for SH3 domains. Putative actin-binding sites and a coiled-coil domain are located at the C terminus of the protein, which also contains a putative leucine zipper motif. CMS mRNA is ubiquitously expressed in adult and fetal human tissues as an approximately 5.4-kb transcript, as detected by Northern blot analysis. CMS induces vesicle formation and colocalizes with p130(Cas) and F-actin to membrane ruffles. It also associates with and is phosphorylated by tyrosine kinases. Kirsch et al. (1999) demonstrated that CMS is able to homodimerize through the coiled-coil domain located in its C terminus.

There was no evidence for intermolecular or intramolecular binding via the SH3 domains and PXXP binding. Animal model experiments lend further support to the function of CD2AP. Shih et al. (1999) generated mice lacking CD2AP by targeted disruption. In CD2AP-deficient mice, immune function was compromised, but the mice died from renal failure at 6 to 7 weeks of age. In the kidney, CD2AP was expressed primarily in glomerular epithelial cells. Knock-out mice exhibited defects in epithelial cell foot processes, accompanied by mesangial cell hyperplasia and extracellular matrix deposition. CD2AP associated with nephrin (OMIM Ref. No. 602716), which is the primary component of the slit diaphragm. This observation supports a role for CD2AP in this specialized cell junction.

[2433] It is appreciated that the abovementioned animal model for CD2AP is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[2434] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[2435] Kirsch, K. H.; Georgescu, M.-M.; Ishimaru, S.; Hanafusa, H. : CMS: an adapter molecule involved in cytoskeletal rear-

rangements. Proc. Nat. Acad. Sci. 96: 6211–6216, 1999. ;
and

[2436] Shih, N.-Y.; Li, J.; Karpitskii, V.; Nguyen, A.; Dustin, M. L.; Kanagawa, O.; Miner, J. H.; Shaw, A. S. : Congenital nephrotic syndrome in mice lacking CD2-associated protein. Science 2.

[2437] Further studies establishing the function and utilities of CD2AP are found in John Hopkins OMIM database record ID 604241, and in cited publications numbered 1198–1200 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Hedgehog Interacting Protein (HHIP, Accession NM_022475) is another VGAM87 host target gene. HHIP BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by HHIP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HHIP BINDING SITE, designated SEQ ID:1989, to the nucleotide sequence of VGAM87 RNA, herein designated VGAM RNA, also designated SEQ ID:422.

[2438] Another function of VGAM87 is therefore inhibition of Hedgehog Interacting Protein (HHIP, Accession

NM_022475), a gene which is involved in many fundamental processes in embryonic development, including anteroposterior patterns of limbs and regulation of left-right asymmetry. Accordingly, utilities of VGAM87 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HHIP. The function of HHIP has been established by previous studies. Chuang and McMahon (1999) cloned a mouse hedgehog-interacting protein cDNA from a limb bud cDNA expression library. They determined that the Hip cDNA encodes a type I transmembrane glycoprotein, which is expressed in all hedgehog target tissues and binds all 3 mammalian hedgehog proteins (SHH, 600725; IHH, 600726; DHH, 605423) with an affinity similar to that of the Ptc protein (OMIM Ref. No. 601309), which is also a component of the Hh signaling pathway. Like Ptc, Hip expression is upregulated in response to Hh signaling. Ectopic expression of Hip in transgenic mice results in severe skeletal defects similar to those observed in Indian hedgehog (IHH) mutants, demonstrating that Hip is involved in the attenuation of hedgehog signaling. By database searching with the mouse Hip sequence as query, followed by RT-PCR and RACE analysis using human adult testis cDNA, Bak et

al. (2001) cloned a HIP cDNA encoding a deduced 700-amino acid protein that shares 94% sequence identity with mouse Hip. By RT-PCR analysis, HIP expression was detected in all fetal and adult tissues examined except fetal ovary and at very low levels in placenta.

[2439] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[2440] Bak, M.; Hansen, C.; Henriksen, K. F.; Tommerup, N. : The human hedgehog-interacting protein gene: structure and chromosome mapping to 4q31.21-q31.3. *Cytogenet. Cell Genet.* 92: 300-303, 2001. ; and

[2441] Chuang, P.-T.; McMahon, A. P. : Vertebrate hedgehog signalling modulated by induction of a hedgehog-binding protein. *Nature* 397: 617-621, 1999.

[2442] Further studies establishing the function and utilities of HHIP are found in John Hopkins OMIM database record ID 606178, and in cited publications numbered 988-989 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. A Kinase (PRKA) Anchor Protein 7 (AKAP7, Accession NM_004842) is another VGAM87 host target gene. AKAP7 BINDING SITE1 through AKAP7 BINDING SITE3 are HOST TARGET binding

sites found in untranslated regions of mRNA encoded by AKAP7, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AKAP7 BINDING SITE1 through AKAP7 BINDING SITE3, designated SEQ ID:1159, SEQ ID:1683 and SEQ ID:2446 respectively, to the nucleotide sequence of VGAM87 RNA, herein designated VGAM RNA, also designated SEQ ID:422.

[2443] Another function of VGAM87 is therefore inhibition of A Kinase (PRKA) Anchor Protein 7 (AKAP7, Accession NM_004842). Accordingly, utilities of VGAM87 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AKAP7. Chromosome 22 Open Reading Frame 19 (C22orf19, Accession NM_003678) is another VGAM87 host target gene. C22orf19 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C22orf19, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C22orf19 BINDING SITE, designated SEQ ID:1048, to the nucleotide sequence of VGAM87 RNA, herein designated

VGAM RNA, also designated SEQ ID:422.

[2444] Another function of VGAM87 is therefore inhibition of Chromosome 22 Open Reading Frame 19 (C22orf19, Accession NM_003678). Accordingly, utilities of VGAM87 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C22orf19. DKFZp566D234 (Accession XM_030162) is another VGAM87 host target gene. DKFZp566D234 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZp566D234, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp566D234 BINDING SITE, designated SEQ ID:2611, to the nucleotide sequence of VGAM87 RNA, herein designated VGAM RNA, also designated SEQ ID:422.

[2445] Another function of VGAM87 is therefore inhibition of DKFZp566D234 (Accession XM_030162). Accordingly, utilities of VGAM87 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp566D234. FLJ11160 (Accession NM_018344) is another VGAM87 host target gene. FLJ11160 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by FLJ11160, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11160 BINDING SITE, designated SEQ ID:1815, to the nucleotide sequence of VGAM87 RNA, herein designated VGAM RNA, also designated SEQ ID:422.

[2446] Another function of VGAM87 is therefore inhibition of FLJ11160 (Accession NM_018344). Accordingly, utilities of VGAM87 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11160. FLJ13089 (Accession XM_048016) is another VGAM87 host target gene. FLJ13089 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ13089, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13089 BINDING SITE, designated SEQ ID:2899, to the nucleotide sequence of VGAM87 RNA, herein designated VGAM RNA, also designated SEQ ID:422.

[2447] Another function of VGAM87 is therefore inhibition of FLJ13089 (Accession XM_048016). Accordingly, utilities of

VGAM87 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13089. FLJ14297 (Accession NM_024903) is another VGAM87 host target gene. FLJ14297 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ14297, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14297 BINDING SITE, designated SEQ ID:2107, to the nucleotide sequence of VGAM87 RNA, herein designated VGAM RNA, also designated SEQ ID:422.

[2448] Another function of VGAM87 is therefore inhibition of FLJ14297 (Accession NM_024903). Accordingly, utilities of VGAM87 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14297. HSPC065 (Accession NM_014157) is another VGAM87 host target gene. HSPC065 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HSPC065, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HSPC065 BINDING SITE,

designated SEQ ID:1483, to the nucleotide sequence of VGAM87 RNA, herein designated VGAM RNA, also designated SEQ ID:422.

[2449] Another function of VGAM87 is therefore inhibition of HSPC065 (Accession NM_014157). Accordingly, utilities of VGAM87 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HSPC065. LOC150737 (Accession XM_086984) is another VGAM87 host target gene. LOC150737 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC150737, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150737 BINDING SITE, designated SEQ ID:3149, to the nucleotide sequence of VGAM87 RNA, herein designated VGAM RNA, also designated SEQ ID:422.

[2450] Another function of VGAM87 is therefore inhibition of LOC150737 (Accession XM_086984). Accordingly, utilities of VGAM87 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150737. LOC152185 (Accession NM_144718) is another VGAM87 host target gene. LOC152185 BINDING

SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC152185, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152185 BINDING SITE, designated SEQ ID:2498, to the nucleotide sequence of VGAM87 RNA, herein designated VGAM RNA, also designated SEQ ID:422.

[2451] Another function of VGAM87 is therefore inhibition of LOC152185 (Accession NM_144718). Accordingly, utilities of VGAM87 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152185. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 88 (VGAM88) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[2452] VGAM88 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM88 was detected is described hereinabove with reference to Figs. 1-8.

[2453] VGAM88 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus. VGAM88 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[2454] VGAM88 gene encodes a VGAM88 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM88 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM88 precursor RNA is designated SEQ ID:74, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:74 is located at position 29293 relative to the genome of Vaccinia Virus.

[2455] VGAM88 precursor RNA folds onto itself, forming VGAM88 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[2456] An enzyme complex designated DICER COMPLEX, `dices` the VGAM88 folded precursor RNA into VGAM88 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM88 RNA is designated SEQ ID:423, and is provided hereinbelow with reference to the sequence listing part.

[2457] VGAM88 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM88 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM88 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[2458] VGAM88 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM88 host target RNA, herein designated VGAM HOST TARGET RNA. This com-

plementary binding is due to the fact that the nucleotide sequence of VGAM88 RNA is an accurate or a partial inverted-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM88 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM88 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[2459] The complementary binding of VGAM88 RNA, herein designated VGAM RNA, to host target binding sites on VGAM88 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM88 host target RNA into VGAM88 host target protein, herein desig-

nated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[2460] It is appreciated that VGAM88 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM88 host target genes. The mRNA of each one of this plurality of VGAM88 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM88 RNA, herein designated VGAM RNA, and which when bound by VGAM88 RNA causes inhibition of translation of respective one or more VGAM88 host target proteins.

[2461] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM88 gene, herein designated VGAM GENE, on one or more VGAM88 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also

believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[2462] It is yet further appreciated that a function of VGAM88 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM88 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM88 correlate with, and may be deduced from, the identity of the host target genes which VGAM88 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[2463] Nucleotide sequences of the VGAM88 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM88 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM88 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM88 are further described hereinbelow with reference to Table 1.

[2464] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM88 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM88 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[2465] As mentioned hereinabove with reference to Fig. 1, a function of VGAM88 gene, herein designated VGAM is inhibition of expression of VGAM88 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM88 correlate with, and may be deduced from, the identity of the target genes which VGAM88 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[2466] Dishevelled Associated Activator of Morphogenesis 2 (DAAM2, Accession XM_166434) is a VGAM88 host target gene. DAAM2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DAAM2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DAAM2 BINDING SITE, designated SEQ ID:3560, to the nucleotide sequence of VGAM88 RNA,

herein designated VGAM RNA, also designated SEQ ID:423.

[2467] A function of VGAM88 is therefore inhibition of Dishevelled Associated Activator of Morphogenesis 2 (DAAM2, Accession XM_166434), a gene which controls cell polarity and movement during development. Accordingly, utilities of VGAM88 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DAAM2. The function of DAAM2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM15.FN14 (Accession NM_016639) is another VGAM88 host target gene. FN14 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FN14, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FN14 BINDING SITE, designated SEQ ID:1703, to the nucleotide sequence of VGAM88 RNA, herein designated VGAM RNA, also designated SEQ ID:423.

[2468] Another function of VGAM88 is therefore inhibition of FN14 (Accession NM_016639), a gene which may be a

transmembrane protein that reduces plasma membrane associations with vitronectin and fibronectin . Accordingly, utilities of VGAM88 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FN14. The function of FN14 has been established by previous studies. Using a differential display approach to isolate cDNA fragments representing fibroblast growth factor-1 (FGF1; 131220)-inducible genes, Meighan-Mantha et al. (1999) isolated a mouse cDNA encoding Fn14, which they characterized as an immediate-early response gene. By searching an EST database with the mouse Fn14 sequence, Feng et al. (2000) identified cDNAs encoding human FN14. The predicted 129-amino acid FN14 protein, which shares 82% amino acid identity with the mouse sequence, contains a signal peptide, an extracellular domain, a membrane-anchoring domain, and a cytoplasmic domain. Northern blot analysis detected increased FN14 expression in response to FGF1, calf serum, or phorbol ester stimulation of human quiescent fibroblasts in vitro. A 1.2-kb FN14 transcript was expressed at high levels in heart, placenta, and kidney, at intermediate levels in lung, skeletal muscle, and pancreas, and at low levels in brain and liver. In addition, elevated FN14 expression was found

in human liver cancer cell lines and hepatocellular carcinoma specimens. Expression of mouse Fn14 was upregulated in hepatocellular carcinoma nodules that develop in 2 different transgenic mouse models of hepatocarcinogenesis. Rapid induction of Fn14 expression occurred during mouse liver regeneration after partial hepatectomy. Feng et al. (2000) concluded that FN14 may play a role in hepatocyte growth control and liver neoplasia. Using expression cloning and panning of an endothelial cell cDNA library with the C-terminal receptor-binding domain of TWEAK (TNFSF12; 602695) as the probe, followed by slide binding analysis, Wiley et al. (2001) isolated a cDNA encoding FN14, which they termed TWEAKR. Sequence analysis predicted that TWEAKR has a single extracellular cysteine-rich region that is homologous to those observed in TNFRSF1A (OMIM Ref. No. 191190) and some other TNFR family members. TWEAKR also has a cytoplasmic TRAF (see OMIM Ref. No. TRAF2; 601895)-binding site. Different binding analyses indicated a physiologically relevant affinity between TWEAK and TWEAKR. GST-binding analysis showed an interaction of the TWEAKR cytoplasmic region with TRAF1 (OMIM Ref. No. 601711), TRAF2, and, to a lesser extent, TRAF3 (OMIM Ref. No. 601896), but not

with other TRAFs tested. Northern blot analysis revealed expression of a 1.2-kb Tweakr transcript in rat aortic smooth muscle cells. Tweakr expression could be upregulated by a number of growth factors. Blocking of TWEAKR signaling inhibited the migration of renal microvascular cells in vitro, indicating that endogenous TWEAK regulates endothelial cell wound closure rates. Wiley et al. (2001) concluded that TWEAKR is a fully functional receptor for TWEAK and that the TWEAK–TWEAKR system plays a role in endothelial cell growth and migration.

[2470] Feng, S.–L. Y.; Guo, Y.; Factor, V. M.; Thorgeirsson, S. S.; Bell, D. W.; Testa, J. R.; Peifley, K. A.; Winkles, J. A. : The Fn14 immediate–early response gene is induced during liver regeneration and highly expressed in both human and murine hepatocellular carcinomas. *Am. J. Path.* 156: 1253–1261, 2000. ; and

[2471] Wiley, S. R.; Cassiano, L.; Lofton, T.; Davis–Smith, T.; Winkles, J. A.; Lindner, V.; Liu, H.; Daniel, T. O.; Smith, C. A.; Fanslow, W. C. : A novel TNF receptor family member binds TW.

[2472] Further studies establishing the function and utilities of FN14 are found in John Hopkins OMIM database record ID 605914, and in cited publications numbered 181–18 and 1822 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Transmembrane 4 Superfamily Member 2 (TM4SF2, Accession NM_004615) is another VGAM88 host target gene. TM4SF2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TM4SF2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TM4SF2 BINDING SITE, designated SEQ ID:1131, to the nucleotide sequence of VGAM88 RNA, herein designated VGAM RNA, also designated SEQ ID:423.

[2473] Another function of VGAM88 is therefore inhibition of Transmembrane 4 Superfamily Member 2 (TM4SF2, Accession NM_004615). Accordingly, utilities of VGAM88 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TM4SF2. Wingless-type MMTV Integration Site Family, Member 3 (WNT3, Accession NM_030753) is another VGAM88 host target gene. WNT3 BINDING SITE is HOST TARGET binding site found in

the 3' untranslated region of mRNA encoded by WNT3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of WNT3 BINDING SITE, designated SEQ ID:2159, to the nucleotide sequence of VGAM88 RNA, herein designated VGAM RNA, also designated SEQ ID:423.

[2474] Another function of VGAM88 is therefore inhibition of Wingless-type MMTV Integration Site Family, Member 3 (WNT3, Accession NM_030753), a gene which is the ligand for members of the frizzled family of seven transmembrane receptors and has roles in cell-cell signaling. Accordingly, utilities of VGAM88 include diagnosis, prevention and treatment of diseases and clinical conditions associated with WNT3. The function of WNT3 has been established by previous studies. Rider et al. (1989) assigned the INT4 gene to 17q21-q22 using a DNA probe in the study of a panel of chromosome-mediated gene transfectants and conventional hybrids, in particular those with well-defined breaks on human chromosome 17. In situ hybridization was performed for more precise localization. The mouse MMTV integration site int-4 was mapped to mouse chromosome 11 in a region homologous to the re-

gion of human chromosome 17 carrying the INT4 locus. For the group of related genes of which the first to be discovered was INT1 (OMIM Ref. No. 164820), Nusse et al. (1991) suggested the designation Wnt (pronounced 'wint'), a mnemonic for the 'wingless' homolog. The product INT1 (renamed WNT1) encodes a novel secretory glycoprotein similar to the product of the *Drosophila melanogaster* 'wingless' gene. The INT4 locus was renamed WNT3. Roelink et al. (1993) used mouse Wnt3 sequences as a probe to isolate a genomic clone of the human homolog, WNT3. Comparison of the deduced mouse and human WNT3 protein sequences showed 4 changes in 333 amino acids. The gene was localized to 17q21 by isotopic in situ hybridization. Several studies had implicated Wnt signaling in primary axis formation during vertebrate embryogenesis, yet no Wnt protein had been shown to be essential for this process. In the mouse, primitive streak formation is the first overt morphologic sign of the anterior-posterior axis in mesoderm. Liu et al. (1999) generated Wnt3 $-/-$ mice by targeted disruption of the mouse Wnt3 gene. Wnt3 $-/-$ mice developed a normal egg cylinder but did not form a primitive streak, mesoderm, or node. The epiblast continued to proliferate in an undifferentiated

state that lacked anterior–posterior neural patterning, but anterior visceral endoderm markers were expressed and correctly positioned. Liu et al. (1999) concluded that regional patterning of the visceral endoderm is independent of primitive streak formation, but the subsequent establishment of anterior–posterior neural pattern in the ectoderm is dependent on derivatives of the primitive streak. Their studies provided genetic proof for the requirement of Wnt3 in primary axis formation in the mouse. Using ribonuclease protection analysis, Huguet et al. (1994) investigated expression of WNT genes, including WNT3, in human cell lines, as well as in normal, benign, and malignant breast tissue. They detected WNT3 in breast cell lines and in breast tissue.

[2475] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[2476] Nusse, R.; Brown, A.; Papkoff, J.; Scambler, P.; Shackleford, G.; McMahon, A.; Moon, R.; Varmus, H. : A new nomenclature for int-1 and related genes: the Wnt gene family. Cell 64: 231–232, 1991. ; and

[2477] Rider, S. H.; Gorman, P. A.; Shipley, J.; Roeling, H.; Nusse, R.; Xu, W.; Sheer, D.; Solomon, E. : Localisation of the hu–

man int-4 (INT4) gene. (Abstract) Cytogenet. Cell Genet. 51: 1066.

[2478] Further studies establishing the function and utilities of WNT3 are found in John Hopkins OMIM database record ID 165330, and in cited publications numbered 895, 241 and 2418–2419 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. GLTP (Accession NM_016433) is another VGAM88 host target gene. GLTP BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by GLTP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GLTP BINDING SITE, designated SEQ ID:1686, to the nucleotide sequence of VGAM88 RNA, herein designated VGAM RNA, also designated SEQ ID:423.

[2479] Another function of VGAM88 is therefore inhibition of GLTP (Accession NM_016433). Accordingly, utilities of VGAM88 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GLTP. PRO0149 (Accession NM_014117) is another VGAM88 host target gene. PRO0149 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA

encoded by PRO0149, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO0149 BINDING SITE, designated SEQ ID:1473, to the nucleotide sequence of VGAM88 RNA, herein designated VGAM RNA, also designated SEQ ID:423.

[2480] Another function of VGAM88 is therefore inhibition of PRO0149 (Accession NM_014117). Accordingly, utilities of VGAM88 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO0149. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 89 (VGAM89) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[2481] VGAM89 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM89 was detected is described hereinabove with reference to Figs. 1–8.

[2482] VGAM89 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus. VGAM89

host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[2483] VGAM89 gene encodes a VGAM89 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM89 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM89 precursor RNA is designated SEQ ID:75, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:75 is located at position 25248 relative to the genome of Vaccinia Virus.

[2484] VGAM89 precursor RNA folds onto itself, forming VGAM89 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[2485] An enzyme complex designated DICER COMPLEX, `dices` the VGAM89 folded precursor RNA into VGAM89 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM89 RNA is designated SEQ ID:424, and is provided hereinbelow with reference to the sequence listing part.

[2486] VGAM89 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM89 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM89 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[2487] VGAM89 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM89 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM89 RNA is an accurate or a partial in-

versed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM89 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM89 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[2488] The complementary binding of VGAM89 RNA, herein designated VGAM RNA, to host target binding sites on VGAM89 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM89 host target RNA into VGAM89 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[2489] It is appreciated that VGAM89 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM89 host target genes. The mRNA of each one of this plurality of VGAM89 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM89 RNA, herein designated VGAM RNA, and which when bound by VGAM89 RNA causes inhibition of translation of respective one or more VGAM89 host target proteins.

[2490] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM89 gene, herein designated VGAM GENE, on one or more VGAM89 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although spe-

cific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[2491] It is yet further appreciated that a function of VGAM89 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM89 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM89 correlate with, and may be deduced from, the identity of the host target genes which VGAM89 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[2492] Nucleotide sequences of the VGAM89 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM89 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM89 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM89 are further described hereinbelow with reference to Table 1.

[2493] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM89 host target RNA, and schematic

representation of the complementarity of each of these host target binding sites to VGAM89 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[2494] As mentioned hereinabove with reference to Fig. 1, a function of VGAM89 gene, herein designated VGAM is inhibition of expression of VGAM89 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM89 correlate with, and may be deduced from, the identity of the target genes which VGAM89 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[2495] Lysosomal-associated Membrane Protein 2 (LAMP2, Accession NM_013995) is a VGAM89 host target gene. LAMP2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LAMP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LAMP2 BINDING SITE, designated SEQ ID:1455, to the nucleotide sequence of VGAM89 RNA, herein designated VGAM RNA, also designated SEQ ID:424.

[2496] A function of VGAM89 is therefore inhibition of Lysosomal-associated Membrane Protein 2 (LAMP2, Accession NM_013995). Accordingly, utilities of VGAM89 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LAMP2. DKFZp762K2015 (Accession XM_051791) is another VGAM89 host target gene. DKFZp762K2015 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZp762K2015, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp762K2015 BINDING SITE, designated SEQ ID:2949, to the nucleotide sequence of VGAM89 RNA, herein designated VGAM RNA, also designated SEQ ID:424.

[2497] Another function of VGAM89 is therefore inhibition of DKFZp762K2015 (Accession XM_051791). Accordingly, utilities of VGAM89 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp762K2015. FLJ10921 (Accession NM_018272) is another VGAM89 host target gene. FLJ10921 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ10921, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10921 BINDING SITE, designated SEQ ID:1808, to the nucleotide sequence of VGAM89 RNA, herein designated VGAM RNA, also designated SEQ ID:424.

[2498] Another function of VGAM89 is therefore inhibition of FLJ10921 (Accession NM_018272). Accordingly, utilities of VGAM89 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10921. LOC91752 (Accession XM_040403) is another VGAM89 host target gene. LOC91752 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC91752, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91752 BINDING SITE, designated SEQ ID:2778, to the nucleotide sequence of VGAM89 RNA, herein designated VGAM RNA, also designated SEQ ID:424.

[2499] Another function of VGAM89 is therefore inhibition of LOC91752 (Accession XM_040403). Accordingly, utilities of VGAM89 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LOC91752. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 90 (VGAM90) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[2500] VGAM90 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM90 was detected is described hereinabove with reference to Figs. 1–8.

[2501] VGAM90 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus. VGAM90 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[2502] VGAM90 gene encodes a VGAM90 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM90 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM90 precursor RNA is designated SEQ ID:76, and is provided hereinbelow with reference to the

sequence listing part. Nucleotide sequence SEQ ID:76 is located at position 29027 relative to the genome of Vaccinia Virus.

[2503] VGAM90 precursor RNA folds onto itself, forming VGAM90 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[2504] An enzyme complex designated DICER COMPLEX, `dices` the VGAM90 folded precursor RNA into VGAM90 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 76%) nucleotide sequence of VGAM90 RNA is designated SEQ ID:425, and is provided hereinbelow with reference to the sequence listing part.

[2505] VGAM90 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM90 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM90 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[2506] VGAM90 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM90 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM90 RNA is an accurate or a partial inverted-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM90 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of

a VGAM90 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[2507] The complementary binding of VGAM90 RNA, herein designated VGAM RNA, to host target binding sites on VGAM90 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM90 host target RNA into VGAM90 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[2508] It is appreciated that VGAM90 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM90 host target genes. The mRNA of each one of this plurality of VGAM90 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM90 RNA, herein designated VGAM RNA, and which when bound by VGAM90 RNA causes inhibition of translation of respective one or more VGAM90

host target proteins.

[2509] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM90 gene, herein designated VGAM GENE, on one or more VGAM90 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[2510] It is yet further appreciated that a function of VGAM90 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM90 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM90 correlate

with, and may be deduced from, the identity of the host target genes which VGAM90 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[2511] Nucleotide sequences of the VGAM90 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM90 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM90 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM90 are further described hereinbelow with reference to Table 1.

[2512] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM90 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM90 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[2513] As mentioned hereinabove with reference to Fig. 1, a function of VGAM90 gene, herein designated VGAM is inhibition of expression of VGAM90 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM90 correlate with, and may be deduced from, the

identity of the target genes which VGAM90 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[2514] Glucagon-like Peptide 1 Receptor (GLP1R, Accession NM_002062) is a VGAM90 host target gene. GLP1R BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GLP1R, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GLP1R BINDING SITE, designated SEQ ID:896, to the nucleotide sequence of VGAM90 RNA, herein designated VGAM RNA, also designated SEQ ID:425.

[2515] A function of VGAM90 is therefore inhibition of Glucagon-like Peptide 1 Receptor (GLP1R, Accession NM_002062), a gene which is mediated by g proteins which activate adenylyl cyclase. Accordingly, utilities of VGAM90 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GLP1R. The function of GLP1R has been established by previous studies. Glucagon-like peptide-1 (GLP1) is a hormone derived from the proglucagon molecule (OMIM Ref. No. 138030) and is secreted by intestinal L cells. It is the most

potent stimulator of glucose-induced insulin secretion and also suppresses in vivo acid secretion by gastric glands. By transient expression of a rat pancreatic islet cDNA library in COS cells, Thorens (1992) isolated a cDNA for the GLP1 receptor (GLP1R). Transfected into COS cells, the receptor bound GLP1 with high affinity and was coupled to activation of adenylate cyclase. It did not bind peptides of related structure and similar function, such as glucagon (GCG; 138030), gastric inhibitory polypeptide (GIP; 137240), vasoactive intestinal peptide (VIP; 192320), or secretin (SCT; 182099). The receptor is 463 amino acids long and contains 7 transmembrane domains. Sequence homology was found only with the receptors for secretin (SCTR; 182098), calcitonin (CALCR; 114131), and parathyroid hormone (PTHr; 168468), which together form a newly characterized family of G-coupled receptors. Dillon et al. (1993) also cloned a cDNA corresponding to the GLP1R gene. By promoter analysis and electrophoretic mobility shift analysis, Wildhage et al. (1999) showed that the GLP1R promoter binds both SP1 (OMIM Ref. No. 189906) and SP3 (OMIM Ref. No. 601804). They concluded that the basal activity of the GLP1R gene is mediated by 2 proximal SP1-binding sites and that a more dis-

tal site acts as a repressor.

[2516] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[2517] Dillon, J. S.; Tanizawa, Y.; Wheeler, M. B.; Leng, X.-H.; Ligon, B. B.; Rabin, D. U.; Yoo-Warren, H.; Permutt, M. A.; Boyd, A. E., III : Cloning and functional expression of the human glucagon-like peptide-1 (GLP-1) receptor. *Endocrinology* 133: 1907-1910, 1993. ; and

[2518] Wildhage, I.; Trusheim, H.; Goke, B.; Lankat-Buttgereit, B. : Gene expression of the human glucagon-like peptide-1 receptor is regulated by Sp1 and Sp3. *Endocrinology* 140: 624-631, 1999.

[2519] Further studies establishing the function and utilities of GLP1R are found in John Hopkins OMIM database record ID 138032, and in cited publications numbered 717-72 and 775 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. FLJ10891 (Accession NM_018260) is another VGAM90 host target gene. FLJ10891 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10891, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING

SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10891 BINDING SITE, designated SEQ ID:1806, to the nucleotide sequence of VGAM90 RNA, herein designated VGAM RNA, also designated SEQ ID:425.

[2520] Another function of VGAM90 is therefore inhibition of FLJ10891 (Accession NM_018260). Accordingly, utilities of VGAM90 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10891. KIAA0781 (Accession XM_041314) is another VGAM90 host target gene. KIAA0781 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0781, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0781 BINDING SITE, designated SEQ ID:2793, to the nucleotide sequence of VGAM90 RNA, herein designated VGAM RNA, also designated SEQ ID:425.

[2521] Another function of VGAM90 is therefore inhibition of KIAA0781 (Accession XM_041314). Accordingly, utilities of VGAM90 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA0781. KIAA1077 (Accession XM_053496) is another VGAM90 host target gene. KIAA1077 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1077, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1077 BINDING SITE, designated SEQ ID:2963, to the nucleotide sequence of VGAM90 RNA, herein designated VGAM RNA, also designated SEQ ID:425.

[2522] Another function of VGAM90 is therefore inhibition of KIAA1077 (Accession XM_053496). Accordingly, utilities of VGAM90 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1077. Pellino Homolog 2 (Drosophila) (PELI2, Accession NM_021255) is another VGAM90 host target gene. PELI2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PELI2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PELI2 BINDING SITE, designated SEQ ID:1950, to the nucleotide sequence of VGAM90 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:425.

[2523] Another function of VGAM90 is therefore inhibition of Pellino Homolog 2 (Drosophila) (PELI2, Accession NM_021255). Accordingly, utilities of VGAM90 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PELI2. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 91 (VGAM91) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[2524] VGAM91 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM91 was detected is described hereinabove with reference to Figs. 1–8.

[2525] VGAM91 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus. VGAM91 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[2526] VGAM91 gene encodes a VGAM91 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM91

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM91 precursor RNA is designated SEQ ID:77, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:77 is located at position 32319 relative to the genome of Vaccinia Virus.

[2527] VGAM91 precursor RNA folds onto itself, forming VGAM91 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[2528] An enzyme complex designated DICER COMPLEX, `dices` the VGAM91 folded precursor RNA into VGAM91 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 75%) nucleotide sequence of VGAM91 RNA is designated SEQ ID:426, and is provided hereinbelow with reference to the sequence listing part.

[2529] VGAM91 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM91 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM91 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[2530] VGAM91 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM91 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM91 RNA is an accurate or a partial inverted-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host tar-

get binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM91 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM91 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[2531] The complementary binding of VGAM91 RNA, herein designated VGAM RNA, to host target binding sites on VGAM91 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM91 host target RNA into VGAM91 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[2532] It is appreciated that VGAM91 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM91 host target genes. The mRNA of each one of this plurality of VGAM91 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM91 RNA, herein designated VGAM RNA, and which when bound by VGAM91 RNA causes inhibition of translation of respective one or more VGAM91 host target proteins.

[2533] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM91 gene, herein designated VGAM GENE, on one or more VGAM91 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[2534] It is yet further appreciated that a function of VGAM91 is inhibition of expression of host target genes, as part of a

novel viral mechanism of attacking a host. Accordingly, utilities of VGAM91 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM91 correlate with, and may be deduced from, the identity of the host target genes which VGAM91 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[2535] Nucleotide sequences of the VGAM91 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM91 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM91 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM91 are further described hereinbelow with reference to Table 1.

[2536] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM91 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM91 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[2537] As mentioned hereinabove with reference to Fig. 1, a

function of VGAM91 gene, herein designated VGAM is inhibition of expression of VGAM91 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM91 correlate with, and may be deduced from, the identity of the target genes which VGAM91 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[2538] G Protein-coupled Receptor Kinase 6 (GPRK6, Accession NM_002082) is a VGAM91 host target gene. GPRK6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GPRK6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GPRK6 BINDING SITE, designated SEQ ID:898, to the nucleotide sequence of VGAM91 RNA, herein designated VGAM RNA, also designated SEQ ID:426.

[2539] A function of VGAM91 is therefore inhibition of G Protein-coupled Receptor Kinase 6 (GPRK6, Accession NM_002082), a gene which regulates the G protein-coupled receptors. Accordingly, utilities of VGAM91 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GPRK6. The function of

GPRK6 has been established by previous studies. By PCR on neutrophil cDNA using primers based on sequences of known receptor kinases, Haribabu and Snyderman (1993) identified GPRK5 (OMIM Ref. No. 600870) and GPRK6 sequences. Using a fragment of the GPRK6 PCR clone to screen a cDNA library, they isolated a cDNA encoding GPRK6. Sequence analysis predicted that the 544-amino acid GPRK6 protein contains the conserved DLG (asp-leu-gly) and ENIL (glu-asn-ile-leu) motifs. Northern blot analysis detected 2.1- and 2.9-kb GPRK6 transcripts in all tissues tested, with strongest expression in placenta and skeletal muscle. By somatic cell hybrid analysis, Haribabu and Snyderman (1993) mapped the GPRK6 gene and a closely related gene to chromosomes 5 and 13, respectively. Bullrich et al. (1995) mapped GPRK6 to 5q35 by analysis of a rodent human hybrid panel. The GPRK6-related locus was found to map to 13pter-q21.

[2540] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[2541] Bullrich, F.; Druck, T.; Kunapuli, P.; Gomez, J.; Gripp, K. W.; Schlegelberger, B.; Lasota, J.; Aronson, M.; Cannizzaro, L. A.; Huebner, K.; Benovic, J. L. : Chromosomal mapping

of the genes GPRK5 and GPRK6 encoding G protein-coupled receptor kinases GRK5 and GRK6. Cytogenet. Cell Genet. 70: 250–254, 1995. ; and

[2542] Haribabu, B.; Snyderman, R. : Identification of additional members of human G-protein-coupled receptor kinase multigene family. Proc. Nat. Acad. Sci. 90: 9398–9402, 1993.

[2543] Further studies establishing the function and utilities of GPRK6 are found in John Hopkins OMIM database record ID 600869, and in cited publications numbered 1613–1614 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. WWP1 (Accession XM_087357) is another VGAM91 host target gene. WWP1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by WWP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of WWP1 BINDING SITE, designated SEQ ID:3164, to the nucleotide sequence of VGAM91 RNA, herein designated VGAM RNA, also designated SEQ ID:426.

[2544] Another function of VGAM91 is therefore inhibition of

WWP1 (Accession XM_087357). Accordingly, utilities of VGAM91 include diagnosis, prevention and treatment of diseases and clinical conditions associated with WWP1. LOC144559 (Accession XM_084896) is another VGAM91 host target gene. LOC144559 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC144559, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144559 BINDING SITE, designated SEQ ID:3067, to the nucleotide sequence of VGAM91 RNA, herein designated VGAM RNA, also designated SEQ ID:426.

[2545] Another function of VGAM91 is therefore inhibition of LOC144559 (Accession XM_084896). Accordingly, utilities of VGAM91 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144559. LOC200163 (Accession XM_114136) is another VGAM91 host target gene. LOC200163 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC200163, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC200163 BINDING SITE, designated SEQ ID:3440, to the nucleotide sequence of VGAM91 RNA, herein designated VGAM RNA, also designated SEQ ID:426.

[2546] Another function of VGAM91 is therefore inhibition of LOC200163 (Accession XM_114136). Accordingly, utilities of VGAM91 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200163. LOC219918 (Accession XM_166197) is another VGAM91 host target gene. LOC219918 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC219918, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219918 BINDING SITE, designated SEQ ID:3531, to the nucleotide sequence of VGAM91 RNA, herein designated VGAM RNA, also designated SEQ ID:426.

[2547] Another function of VGAM91 is therefore inhibition of LOC219918 (Accession XM_166197). Accordingly, utilities of VGAM91 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219918. LOC220071 (Accession XM_167848) is an-

other VGAM91 host target gene. LOC220071 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC220071, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220071 BINDING SITE, designated SEQ ID:3603, to the nucleotide sequence of VGAM91 RNA, herein designated VGAM RNA, also designated SEQ ID:426.

[2548] Another function of VGAM91 is therefore inhibition of LOC220071 (Accession XM_167848). Accordingly, utilities of VGAM91 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220071. LOC255515 (Accession XM_171185) is another VGAM91 host target gene. LOC255515 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC255515, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255515 BINDING SITE, designated SEQ ID:3689, to the nucleotide sequence of VGAM91 RNA, herein designated VGAM RNA, also designated SEQ ID:426.

[2549] Another function of VGAM91 is therefore inhibition of LOC255515 (Accession XM_171185). Accordingly, utilities of VGAM91 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255515. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 92 (VGAM92) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[2550] VGAM92 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM92 was detected is described hereinabove with reference to Figs. 1–8.

[2551] VGAM92 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus. VGAM92 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[2552] VGAM92 gene encodes a VGAM92 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM92 precursor RNA does not encode a protein. A nucleotide

sequence identical or highly similar to the nucleotide sequence of VGAM92 precursor RNA is designated SEQ ID:78, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:78 is located at position 31579 relative to the genome of Vaccinia Virus.

[2553] VGAM92 precursor RNA folds onto itself, forming VGAM92 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[2554] An enzyme complex designated DICER COMPLEX, `dices` the VGAM92 folded precursor RNA into VGAM92 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 76%) nucleotide se-

quence of VGAM92 RNA is designated SEQ ID:427, and is provided hereinbelow with reference to the sequence listing part.

[2555] VGAM92 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM92 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM92 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[2556] VGAM92 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM92 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM92 RNA is an accurate or a partial inverted-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustrat-

tion only, and is not meant to be limiting – VGAM92 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM92 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[2557] The complementary binding of VGAM92 RNA, herein designated VGAM RNA, to host target binding sites on VGAM92 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM92 host target RNA into VGAM92 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[2558] It is appreciated that VGAM92 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM92 host target genes. The mRNA of each one of this plurality of VGAM92 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM92 RNA, herein designated VGAM RNA, and which when bound by VGAM92 RNA causes inhibition of translation of respective one or more VGAM92 host target proteins.

- [2559] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM92 gene, herein designated VGAM GENE, on one or more VGAM92 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).
- [2560] It is yet further appreciated that a function of VGAM92 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM92 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM92 correlate with, and may be deduced from, the identity of the host target genes which VGAM92 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[2561] Nucleotide sequences of the VGAM92 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM92 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM92 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM92 are further described hereinbelow with reference to Table 1.

[2562] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM92 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM92 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[2563] As mentioned hereinabove with reference to Fig. 1, a function of VGAM92 gene, herein designated VGAM is in-

hibition of expression of VGAM92 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM92 correlate with, and may be deduced from, the identity of the target genes which VGAM92 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[2564] B-cell CLL/lymphoma 11B (zinc finger protein) (BCL11B, Accession NM_022898) is a VGAM92 host target gene. BCL11B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BCL11B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BCL11B BINDING SITE, designated SEQ ID:2020, to the nucleotide sequence of VGAM92 RNA, herein designated VGAM RNA, also designated SEQ ID:427.

[2565] A function of VGAM92 is therefore inhibition of B-cell CLL/lymphoma 11B (zinc finger protein) (BCL11B, Accession NM_022898). Accordingly, utilities of VGAM92 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BCL11B. Membrane Component, Chromosome 17, Surface Marker 2 (ovarian

carcinoma antigen CA125) (M17S2, Accession NM_031858) is another VGAM92 host target gene. M17S2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by M17S2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of M17S2 BINDING SITE, designated SEQ ID:2213, to the nucleotide sequence of VGAM92 RNA, herein designated VGAM RNA, also designated SEQ ID:427.

[2566] Another function of VGAM92 is therefore inhibition of Membrane Component, Chromosome 17, Surface Marker 2 (ovarian carcinoma antigen CA125) (M17S2, Accession NM_031858), a gene which Contains a B-box/coiled coil motif. Accordingly, utilities of VGAM92 include diagnosis, prevention and treatment of diseases and clinical conditions associated with M17S2. The function of M17S2 has been established by previous studies. In an attempt to clone the CA125 gene (OMIM Ref. No. 606154), Campbell et al. (1994) isolated a cDNA from an expression library that mapped close to the BRCA1 locus (OMIM Ref. No. 113705) at 17q21.1. Closer investigation showed that it was within the smallest known region containing the

BRCA1 gene. The predicted 966–amino acid polypeptide lacks the membrane protein characteristics expected for CA125 but does include a B–box/coiled coil motif present in many genes with transformation potential. Campbell et al. (1994) used fluorescence in situ hybridization to demonstrate mapping within the BRCA1 minimum region. YAC and cosmid clones were isolated and used to refine the location of this gene adjacent and proximal to the RNU2 locus (OMIM Ref. No. 180690). The exon structure of the gene was also determined. Extensive SSCP and sequence analysis of over 100 tumor and normal DNAs from familial and sporadic breast cancers and sporadic ovarian cancers failed to detect mutations in the coding region of this gene. Brown et al. (1994), who referred to the gene as 1A1–3B, showed that the transcription start site of M17S2 is 295 bp distal from the initiation site of BRCA1 and that the gene is transcribed divergently from BRCA1. The authors speculated that M17S2 may be involved in the regulation of transcription or translation of BRCA1. Brown et al. (1996) described the genomic region that encompasses both the BRCA1 and M17S2 genes. They found a tandem duplication of 30 kb that results in 2 copies of exons 1 and 2 of BRCA1 and exons 1 and 3 of M17S2.

[2567] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[2568] Brown, M. A.; Xu, C.-F.; Nicolai, H.; Griffiths, B.; Chambers, J. A.; Black, D.; Solomon, E. : The 5-prime end of the BRCA1 gene lies within a duplicated region of human chromosome 17q21. *Oncogene* 12: 2507-2513, 1996. ; and

[2569] Campbell, I. G.; Nicolai, H. M.; Foulkes, W. D.; Senger, G.; Stamp, G. W.; Allan, G.; Boyer, C.; Jones, K.; Bast, R. C., Jr.; Solomon, E.; Trowsdale, J.; Black, D. M. : A novel gene encoding.

[2570] Further studies establishing the function and utilities of M17S2 are found in John Hopkins OMIM database record ID 166945, and in cited publications numbered 389-391 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. CRFG (Accession XM_040267) is another VGAM92 host target gene. CRFG BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CRFG, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

CRFG BINDING SITE, designated SEQ ID:2775, to the nucleotide sequence of VGAM92 RNA, herein designated VGAM RNA, also designated SEQ ID:427.

[2571] Another function of VGAM92 is therefore inhibition of CRFG (Accession XM_040267). Accordingly, utilities of VGAM92 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CRFG. FLJ23360 (Accession NM_023076) is another VGAM92 host target gene. FLJ23360 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ23360, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23360 BINDING SITE, designated SEQ ID:2030, to the nucleotide sequence of VGAM92 RNA, herein designated VGAM RNA, also designated SEQ ID:427.

[2572] Another function of VGAM92 is therefore inhibition of FLJ23360 (Accession NM_023076). Accordingly, utilities of VGAM92 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23360. KIAA0349 (Accession XM_166449) is another VGAM92 host target gene. KIAA0349 BINDING SITE is HOST TARGET

binding site found in the 3' untranslated region of mRNA encoded by KIAA0349, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0349 BINDING SITE, designated SEQ ID:3561, to the nucleotide sequence of VGAM92 RNA, herein designated VGAM RNA, also designated SEQ ID:427.

[2573] Another function of VGAM92 is therefore inhibition of KIAA0349 (Accession XM_166449). Accordingly, utilities of VGAM92 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0349. PRO2325 (Accession NM_018523) is another VGAM92 host target gene. PRO2325 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PRO2325, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO2325 BINDING SITE, designated SEQ ID:1836, to the nucleotide sequence of VGAM92 RNA, herein designated VGAM RNA, also designated SEQ ID:427.

[2574] Another function of VGAM92 is therefore inhibition of

PRO2325 (Accession NM_018523). Accordingly, utilities of VGAM92 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO2325. SCYA16 (Accession NM_004590) is another VGAM92 host target gene. SCYA16 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SCYA16, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SCYA16 BINDING SITE, designated SEQ ID:1130, to the nucleotide sequence of VGAM92 RNA, herein designated VGAM RNA, also designated SEQ ID:427.

[2575] Another function of VGAM92 is therefore inhibition of SCYA16 (Accession NM_004590). Accordingly, utilities of VGAM92 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SCYA16. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 93 (VGAM93) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[2576] VGAM93 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM93 was detected is described hereinabove with reference to Figs. 1–8.

[2577] VGAM93 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus. VGAM93 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[2578] VGAM93 gene encodes a VGAM93 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM93 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM93 precursor RNA is designated SEQ ID:79, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:79 is located at position 32553 relative to the genome of Vaccinia Virus.

[2579] VGAM93 precursor RNA folds onto itself, forming VGAM93 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is

due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[2580] An enzyme complex designated DICER COMPLEX, `dices` the VGAM93 folded precursor RNA into VGAM93 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 89%) nucleotide sequence of VGAM93 RNA is designated SEQ ID:428, and is provided hereinbelow with reference to the sequence listing part.

[2581] VGAM93 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM93 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM93 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[2582] VGAM93 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM93 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM93 RNA is an accurate or a partial inverted-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM93 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM93 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR and 5' UTR regions.

[2583] The complementary binding of VGAM93 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM93 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM93 host target RNA into VGAM93 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[2584] It is appreciated that VGAM93 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM93 host target genes. The mRNA of each one of this plurality of VGAM93 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM93 RNA, herein designated VGAM RNA, and which when bound by VGAM93 RNA causes inhibition of translation of respective one or more VGAM93 host target proteins.

[2585] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM93 gene, herein designated VGAM GENE, on one or more VGAM93 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with

reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[2586] It is yet further appreciated that a function of VGAM93 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM93 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM93 correlate with, and may be deduced from, the identity of the host target genes which VGAM93 binds and inhibits, and the function of these host target genes, as elaborated herein-below.

[2587] Nucleotide sequences of the VGAM93 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM93 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of

VGAM93 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM93 are further described hereinbelow with reference to Table 1.

[2588] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM93 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM93 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[2589] As mentioned hereinabove with reference to Fig. 1, a function of VGAM93 gene, herein designated VGAM is inhibition of expression of VGAM93 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM93 correlate with, and may be deduced from, the identity of the target genes which VGAM93 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[2590] DJ-1 (Accession NM_007262) is a VGAM93 host target gene. DJ-1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DJ-1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Ta-

ble 2 illustrates the complementarity of the nucleotide sequences of DJ-1 BINDING SITE, designated SEQ ID:1375, to the nucleotide sequence of VGAM93 RNA, herein designated VGAM RNA, also designated SEQ ID:428.

[2591] A function of VGAM93 is therefore inhibition of DJ-1 (Accession NM_007262). Accordingly, utilities of VGAM93 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DJ-1. FLJ10535 (Accession NM_018129) is another VGAM93 host target gene. FLJ10535 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10535, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10535 BINDING SITE, designated SEQ ID:1787, to the nucleotide sequence of VGAM93 RNA, herein designated VGAM RNA, also designated SEQ ID:428.

[2592] Another function of VGAM93 is therefore inhibition of FLJ10535 (Accession NM_018129). Accordingly, utilities of VGAM93 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10535. FLJ10539 (Accession NM_018130) is another VGAM93

host target gene. FLJ10539 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10539, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10539 BINDING SITE, designated SEQ ID:1788, to the nucleotide sequence of VGAM93 RNA, herein designated VGAM RNA, also designated SEQ ID:428.

[2593] Another function of VGAM93 is therefore inhibition of FLJ10539 (Accession NM_018130). Accordingly, utilities of VGAM93 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10539. Phosphatidylinositol (4,5) Bisphosphate 5-phosphatase, A (PIB5PA, Accession XM_038489) is another VGAM93 host target gene. PIB5PA BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PIB5PA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PIB5PA BINDING SITE, designated SEQ ID:2739, to the nucleotide sequence of VGAM93 RNA, herein designated VGAM RNA, also designated SEQ

ID:428.

[2594] Another function of VGAM93 is therefore inhibition of Phosphatidylinositol (4,5) Bisphosphate 5-phosphatase, A (PIB5PA, Accession XM_038489). Accordingly, utilities of VGAM93 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PIB5PA. LOC149351 (Accession XM_086503) is another VGAM93 host target gene. LOC149351 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC149351, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149351 BINDING SITE, designated SEQ ID:3130, to the nucleotide sequence of VGAM93 RNA, herein designated VGAM RNA, also designated SEQ ID:428.

[2595] Another function of VGAM93 is therefore inhibition of LOC149351 (Accession XM_086503). Accordingly, utilities of VGAM93 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149351. LOC157858 (Accession XM_098833) is another VGAM93 host target gene. LOC157858 BINDING SITE is HOST TARGET binding site found in the 5' un-

translated region of mRNA encoded by LOC157858, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157858 BINDING SITE, designated SEQ ID:3384, to the nucleotide sequence of VGAM93 RNA, herein designated VGAM RNA, also designated SEQ ID:428.

[2596] Another function of VGAM93 is therefore inhibition of LOC157858 (Accession XM_098833). Accordingly, utilities of VGAM93 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157858. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 94 (VGAM94) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[2597] VGAM94 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM94 was detected is described hereinabove with reference to Figs. 1–8.

[2598] VGAM94 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Vaccinia Virus. VGAM94 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[2599] VGAM94 gene encodes a VGAM94 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM94 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM94 precursor RNA is designated SEQ ID:80, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:80 is located at position 32481 relative to the genome of Vaccinia Virus.

[2600] VGAM94 precursor RNA folds onto itself, forming VGAM94 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[2601] An enzyme complex designated DICER COMPLEX, `dices`

the VGAM94 folded precursor RNA into VGAM94 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM94 RNA is designated SEQ ID:429, and is provided hereinbelow with reference to the sequence listing part.

[2602] VGAM94 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM94 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM94 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[2603] VGAM94 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM94 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide

sequence of VGAM94 RNA is an accurate or a partial inverted-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM94 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM94 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR and 5' UTR regions.

[2604] The complementary binding of VGAM94 RNA, herein designated VGAM RNA, to host target binding sites on VGAM94 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM94 host target RNA into VGAM94 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target

protein is therefore outlined by a broken line.

[2605] It is appreciated that VGAM94 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM94 host target genes. The mRNA of each one of this plurality of VGAM94 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM94 RNA, herein designated VGAM RNA, and which when bound by VGAM94 RNA causes inhibition of translation of respective one or more VGAM94 host target proteins.

[2606] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM94 gene, herein designated VGAM GENE, on one or more VGAM94 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression

of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[2607] It is yet further appreciated that a function of VGAM94 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM94 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM94 correlate with, and may be deduced from, the identity of the host target genes which VGAM94 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[2608] Nucleotide sequences of the VGAM94 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM94 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM94 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM94 are further described hereinbelow with reference to Table 1.

[2609] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on VGAM94 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM94 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[2610] As mentioned hereinabove with reference to Fig. 1, a function of VGAM94 gene, herein designated VGAM is inhibition of expression of VGAM94 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM94 correlate with, and may be deduced from, the identity of the target genes which VGAM94 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[2611] Discs, Large (Drosophila) Homolog 5 (DLG5, Accession XM_096398) is a VGAM94 host target gene. DLG5 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DLG5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DLG5 BINDING SITE, designated SEQ ID:3265, to the nucleotide sequence of VGAM94 RNA, herein designated VGAM RNA, also designated SEQ ID:429.

[2612] A function of VGAM94 is therefore inhibition of Discs, Large (Drosophila) Homolog 5 (DLG5, Accession XM_096398), a gene which may transmit extracellular signals to inhibit cell proliferation. Accordingly, utilities of VGAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DLG5. The function of DLG5 has been established by previous studies. Vertebrate homologs of the Drosophila discs large (dlg) gene are members of the MAGUK (membrane-associated guanylate kinase) family. See 602887. MAGUK proteins contain PDZ motifs, an SH3 domain, and a guanylate kinase (GUK)-homologous region. Both the PDZ and GUK domains are thought to contribute to protein-protein interactions. By searching an EST database for sequences related to Drosophila dlg, Nakamura et al. (1998) identified cDNAs encoding a novel human homolog. Northern blot analysis revealed that the 9.4-kb transcript was highly expressed in placenta and prostate, as well as in several other tissues, leading the authors to designate the gene PDLG (placenta and prostate DLG). An additional 8.8-kb PDLG mRNA was detected in thyroid. The predicted 859-amino acid PDLG protein contains 3 PDZ domains, an SH3 domain, and a

GUK region. PDLG is 45% and 40% identical to DLG1 (OMIM Ref. No. 601014) and *Drosophila* dlg, respectively. Western blot analysis of extracts of human prostate tissue and various cell lines showed that PDLG has an apparent molecular mass of 105 kD. Immunofluorescence experiments indicated that PDLG is localized at the plasma membrane and cytoplasm, and is expressed in the gland epithelial cells of normal prostate tissue but not in prostate cell lines. Using a yeast 2-hybrid screen, Nakamura et al. (1998) determined that PDLG interacts with the GUK domain of p55 (MPP1; 305360), a palmitoylated erythrocyte membrane MAGUK protein. The authors suggested that PDLG and p55 form a heteromeric MAGUK complex at the plasma membrane and cluster various intracellular molecules to play roles in maintaining the structure of epithelial cells and transmitting extracellular signals to the membrane and cytoskeleton. Independently, Nagase et al. (1998) identified KIAA0583, a DLG5 cDNA. By radiation hybrid analysis, they mapped the DLG5 gene to chromosome 10. Using the same technique, Nakamura et al. (1998) refined the localization of the DLG5 gene to 10q23.

[2613] Full details of the abovementioned studies are described

in the following publications, the disclosure of which are hereby incorporated by reference:

[2614] Nagase, T.; Ishikawa, K.; Miyajima, N.; Tanaka, A.; Kotani, H.; Nomura, N.; Ohara, O. : Prediction of the coding sequences of unidentified human genes. IX. The complete sequences of 100 new cDNA clones from brain which can code for large proteins in vitro. DNA Res. 5: 31–39, 1998. ; and

[2615] Nakamura, H.; Sudo, T.; Tsuiki, H.; Miyake, H.; Morisaki, T.; Sasaki, J.; Masuko, N.; Kochi, M.; Ushio, Y.; Saya, H. : Identification of a novel human homolog of the *Drosophila* dlg, P-d.

[2616] Further studies establishing the function and utilities of DLG5 are found in John Hopkins OMIM database record ID 604090, and in cited publications numbered 1563 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Dishevelled, Dsh Homolog 3 (*Drosophila*) (DVL3, Accession NM_004423) is another VGAM94 host target gene. DVL3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DVL3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of DVL3 BINDING SITE, designated SEQ ID:1112, to the nucleotide sequence of VGAM94 RNA, herein designated VGAM RNA, also designated SEQ ID:429.

[2617] Another function of VGAM94 is therefore inhibition of Dishevelled, Dsh Homolog 3 (Drosophila) (DVL3, Accession NM_004423), a gene which regulates cell proliferation. Accordingly, utilities of VGAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DVL3. The function of DVL3 has been established by previous studies. The Drosophila dishevelled gene (*dsh*) encodes a cytoplasmic phosphoprotein (Klingensmith et al., 1994) that regulates cell proliferation, acting as a transducer molecule for developmental processes, including segmentation and neuroblast specification. Pizzuti et al. (1996) noted that *dsh* is required for the function of the wingless gene product *wg*, a segment polarity gene homologous to the mammalian protooncogene WNT1 (OMIM Ref. No. 164820). Pizzuti et al. (1996) reported the isolation and chromosomal mapping of 2 human *dsh* homologs, designated DVL1 (OMIM Ref. No. 601365) and DVL3 by them. The human *dsh* homologs were isolated from a fetal brain cDNA library. DVL3 en-

codes a predicted 716-amino acid polypeptide that shows 74% nucleotide homology with human DVL1 and 71% homology with the mouse Dvl1 gene. DVL1 and DVL3 share 64% amino acid identity. Pizzuti et al. (1996) reported that homology is particularly high in the N-terminal region and that there is more divergence in the C-terminal regions. PCR carried out using DNA from rodent human somatic cell hybrids and DVL3 specific primers led to the assignment of DVL3 to human chromosome 3. Pizzuti et al. (1996) regionally assigned DVL3 to band 3q27 using fluorescence in situ hybridization. Hybridization of poly(A) mRNA with the DVL3 cDNA revealed a 2.9-kb transcript with abundant expression in skeletal muscle, pancreas and heart. They also detected 5.9-kb and 5.0-kb transcripts in skeletal muscle, adult liver, adult heart, pancreas, and placenta. The 5.9-kb form was abundant in fetal tissues but the 5.0-kb form was absent from these tissues. Pizzuti et al. (1996) noted that Charcot-Marie-Tooth type 2B (OMIM Ref. No. 600882) maps to chromosome 3q. Bui et al. (1997) also isolated human DVL3, which shares 98% amino acid identity with mouse Dvl3 and 49% with *Drosophila* dsh. The authors confirmed the chromosomal localization at 3p27. Semenov and Snyder (1997) isolated

3 human genes encoding proteins homologous to *Drosophila* dsh. The cDNA sequence of DVL3 reported by Semenov and Snyder (1997) differs from the previously reported sequences deposited in GenBank. Bui et al. (1997) detected expression of DVL3 mRNA in B cells, breast, kidney, bladder, endometrium, and 2 primary endometrial cultures. It was detected equally in normal human breast tissues and tumors and in colorectal samples of normal tissues, polyps, and tumors.

- [2618] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:
- [2619] Pizzuti, A.; Amati, F.; Calabrese, G.; Mari, A.; Colosimo, A; Silani, V.; Giardino, L.; Ratti, A.; Penso, D.; Calza, L.; Palka, G.; Scarlato, G.; Novelli, G.; Dallapiccola, B. : cDNA characterization and chromosomal mapping of two human homologs of the *Drosophila* dishevelled polarity gene. *Hum. Molec. Genet.* 5: 953–958, 1996. ; and
- [2620] Semenov, M. V.; Snyder, M. : Human dishevelled genes constitute a DHR-containing multigene family. *Genomics* 42: 302–310, 1997.
- [2621] Further studies establishing the function and utilities of DVL3 are found in John Hopkins OMIM database record ID

601368, and in cited publications numbered 2213–1597 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Ectonucleotide Pyrophosphatase/phosphodiesterase 3 (ENPP3, Accession NM_005021) is another VGAM94 host target gene. ENPP3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ENPP3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ENPP3 BINDING SITE, designated SEQ ID:1173, to the nucleotide sequence of VGAM94 RNA, herein designated VGAM RNA, also designated SEQ ID:429.

[2622] Another function of VGAM94 is therefore inhibition of Ectonucleotide Pyrophosphatase/phosphodiesterase 3 (ENPP3, Accession NM_005021). Accordingly, utilities of VGAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ENPP3. Fanconi Anemia, Complementation Group F (FANCF, Accession NM_022725) is another VGAM94 host target gene. FANCF BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FANCF, corresponding to a HOST TARGET binding site such as

BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FANCF BINDING SITE, designated SEQ ID:1998, to the nucleotide sequence of VGAM94 RNA, herein designated VGAM RNA, also designated SEQ ID:429.

[2623] Another function of VGAM94 is therefore inhibition of Fanconi Anemia, Complementation Group F (FANCF, Accession NM_022725). Accordingly, utilities of VGAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FANCF. Protocadherin 11 X-linked (PCDH11X, Accession NM_032968) is another VGAM94 host target gene. PCDH11X BINDING SITE1 and PCDH11X BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PCDH11X, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDH11X BINDING SITE1 and PCDH11X BINDING SITE2, designated SEQ ID:2298 and SEQ ID:2300 respectively, to the nucleotide sequence of VGAM94 RNA, herein designated VGAM RNA, also designated SEQ ID:429.

[2624] Another function of VGAM94 is therefore inhibition of

Protocadherin 11 X-linked (PCDH11X, Accession NM_032968), a gene which is thought to play a fundamental role in cell-cell recognition essential for the segmental development and function of the central nervous system. Accordingly, utilities of VGAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDH11X. The function of PCDH11X and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM49.FLJ10539 (Accession NM_018130) is another VGAM94 host target gene. FLJ10539 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10539, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10539 BINDING SITE, designated SEQ ID:1789, to the nucleotide sequence of VGAM94 RNA, herein designated VGAM RNA, also designated SEQ ID:429.

[2625] Another function of VGAM94 is therefore inhibition of FLJ10539 (Accession NM_018130). Accordingly, utilities of VGAM94 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with FLJ10539. FLJ10898 (Accession XM_002486) is another VGAM94 host target gene. FLJ10898 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10898, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10898 BINDING SITE, designated SEQ ID:2528, to the nucleotide sequence of VGAM94 RNA, herein designated VGAM RNA, also designated SEQ ID:429.

[2626] Another function of VGAM94 is therefore inhibition of FLJ10898 (Accession XM_002486). Accordingly, utilities of VGAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10898. KIAA0680 (Accession NM_014721) is another VGAM94 host target gene. KIAA0680 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0680, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0680 BINDING SITE, designated SEQ ID:1530, to the nucleotide sequence of

VGAM94 RNA, herein designated VGAM RNA, also designated SEQ ID:429.

[2627] Another function of VGAM94 is therefore inhibition of KIAA0680 (Accession NM_014721). Accordingly, utilities of VGAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0680. KIAA1804 (Accession XM_045864) is another VGAM94 host target gene. KIAA1804 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1804, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1804 BINDING SITE, designated SEQ ID:2868, to the nucleotide sequence of VGAM94 RNA, herein designated VGAM RNA, also designated SEQ ID:429.

[2628] Another function of VGAM94 is therefore inhibition of KIAA1804 (Accession XM_045864). Accordingly, utilities of VGAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1804. MO25 (Accession NM_016289) is another VGAM94 host target gene. MO25 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region

of mRNA encoded by MO25, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MO25 BINDING SITE, designated SEQ ID:1677, to the nucleotide sequence of VGAM94 RNA, herein designated VGAM RNA, also designated SEQ ID:429.

[2629] Another function of VGAM94 is therefore inhibition of MO25 (Accession NM_016289). Accordingly, utilities of VGAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MO25. RAB33B, Member RAS Oncogene Family (RAB33B, Accession NM_031296) is another VGAM94 host target gene. RAB33B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RAB33B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAB33B BINDING SITE, designated SEQ ID:2190, to the nucleotide sequence of VGAM94 RNA, herein designated VGAM RNA, also designated SEQ ID:429.

[2630] Another function of VGAM94 is therefore inhibition of

RAB33B, Member RAS Oncogene Family (RAB33B, Accession NM_031296). Accordingly, utilities of VGAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAB33B. RoXaN (Accession NM_025013) is another VGAM94 host target gene. RoXaN BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RoXaN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RoXaN BINDING SITE, designated SEQ ID:2128, to the nucleotide sequence of VGAM94 RNA, herein designated VGAM RNA, also designated SEQ ID:429.

[2631] Another function of VGAM94 is therefore inhibition of RoXaN (Accession NM_025013). Accordingly, utilities of VGAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RoXaN. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 95 (VGAM95) viral gene, which modulates expression of respective host target genes thereof, the function and

utility of which host target genes is known in the art.

[2632] VGAM95 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM95 was detected is described hereinabove with reference to Figs. 1–8.

[2633] VGAM95 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus. VGAM95 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[2634] VGAM95 gene encodes a VGAM95 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM95 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM95 precursor RNA is designated SEQ ID:81, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:81 is located at position 31304 relative to the genome of Vaccinia Virus.

[2635] VGAM95 precursor RNA folds onto itself, forming VGAM95 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin struc-

ture`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[2636] An enzyme complex designated DICER COMPLEX, `dices` the VGAM95 folded precursor RNA into VGAM95 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 75%) nucleotide sequence of VGAM95 RNA is designated SEQ ID:430, and is provided hereinbelow with reference to the sequence listing part.

[2637] VGAM95 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM95 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM95 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING

and 3`UTR respectively.

[2638] VGAM95 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM95 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM95 RNA is an accurate or a partial inverted-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM95 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM95 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[2639] The complementary binding of VGAM95 RNA, herein des-

ignated VGAM RNA, to host target binding sites on VGAM95 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM95 host target RNA into VGAM95 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[2640] It is appreciated that VGAM95 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM95 host target genes. The mRNA of each one of this plurality of VGAM95 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM95 RNA, herein designated VGAM RNA, and which when bound by VGAM95 RNA causes inhibition of translation of respective one or more VGAM95 host target proteins.

[2641] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM95 gene, herein designated VGAM GENE, on one or more VGAM95 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known

non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[2642] It is yet further appreciated that a function of VGAM95 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM95 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM95 correlate with, and may be deduced from, the identity of the host target genes which VGAM95 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[2643] Nucleotide sequences of the VGAM95 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM95 RNA, herein designated VGAM RNA, and

a schematic representation of the secondary folding of VGAM95 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM95 are further described hereinbelow with reference to Table 1.

[2644] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM95 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM95 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[2645] As mentioned hereinabove with reference to Fig. 1, a function of VGAM95 gene, herein designated VGAM is inhibition of expression of VGAM95 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM95 correlate with, and may be deduced from, the identity of the target genes which VGAM95 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[2646] Kinesin Family Member 13A (KIF13A, Accession NM_022113) is a VGAM95 host target gene. KIF13A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIF13A, corre-

sponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIF13A BINDING SITE, designated SEQ ID:1979, to the nucleotide sequence of VGAM95 RNA, herein designated VGAM RNA, also designated SEQ ID:430.

[2647] A function of VGAM95 is therefore inhibition of Kinesin Family Member 13A (KIF13A, Accession NM_022113), a gene which plays a role of motor for anterograde axonal transport of synaptic vesicle precursors (by similarity). Accordingly, utilities of VGAM95 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIF13A. The function of KIF13A has been established by previous studies. Intracellular transport mediated by kinesin superfamily proteins (KIFs; OMIM Ref. No. 604535) is a highly regulated process. Nakagawa et al. (2000) identified mouse Kif13a, a plus end-directed microtubule-dependent motor protein that associates with beta-1 adaptin (AP1B1; 600157), a subunit of the AP1 adaptor complex. The 1,749-amino acid mouse Kif13a protein contains an N-terminal motor domain and an AF6/cno domain. The authors found that the cargo vesicles of Kif13a contain AP1 and mannose 6-phosphate

receptor (M6PR; 154540). Overexpression of Kif13a resulted in mislocalization of AP1 and M6PR, and functional blockade of Kif13a reduced cell-surface expression of M6PR. Thus, the authors concluded that KIF13A transports M6PR-containing vesicles and targets M6PR from the trans-Golgi network to the plasma membrane via direct interaction with the AP1 adaptor complex. Scott (2000) mapped the KIF13A gene to chromosome 6 based on sequence similarity between a KIF13A sequence (GenBank AK025303) and the chromosome 6 clone RP11-500C11 (GenBank AL138724).

[2648] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[2649] Nakagawa, T.; Setou, M.; Seog, D.-H.; Ogasawara, K.; Dohmae, N.; Takio, K.; Hirokawa, N. : A novel motor, KIF13A, transports mannose-6-phosphate receptor to plasma membrane through direct interaction with AP-1 complex. Cell 103: 569-581, 2000. ; and

[2650] Scott, A. F. : Personal Communication. Baltimore, Md., 11/29/2000.

[2651] Further studies establishing the function and utilities of KIF13A are found in John Hopkins OMIM database record

ID 605433, and in cited publications numbered 990–991 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Lysyl Oxidase–like 3 (LOXL3, Accession NM_032603) is another VGAM95 host target gene. LOXL3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOXL3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOXL3 BINDING SITE, designated SEQ ID:2264, to the nucleotide sequence of VGAM95 RNA, herein designated VGAM RNA, also designated SEQ ID:430.

[2652] Another function of VGAM95 is therefore inhibition of Lysyl Oxidase–like 3 (LOXL3, Accession NM_032603), a gene which is expressed in many tissues, the highest levels seen in placenta, heart, ovary, testis, small intestine and spleen. Accordingly, utilities of VGAM95 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOXL3. The function of LOXL3 has been established by previous studies. By database searching for sequences homologous to mouse Lor2, Jourdan–Le Saux et al. (2001) isolated a LOXL3 cDNA encoding a de–

duced 754-amino acid protein with a molecular mass of 83 kD. The protein contains all structural characteristics of the LOX enzyme family, including a copper-binding site with 4 histidyl residues; lysyl and tyrosyl residues and conserved motifs surrounding these sites; and the cytokine receptor-like domain. Like LOXL2 (OMIM Ref. No. 606663), it has 4 scavenger receptor cysteine-rich (SRCR) domains in its N terminus. LOXL3 has a signal peptide sequence, indicating a possible extracellular location, 5 potential N-glycosylation sites, and a predicted procollagen C-proteinase (BMP1; 112264) cleavage site (gly-asp-asp) that is also present in LOX. By Northern blot analysis, Jourdan-Le Saux et al. (2001) detected expression of an approximately 3.3-kb LOXL3 transcript in all tissues tested, with high expression in heart and uterus and low expression in kidney, skeletal muscle, and placenta. Unlike other members of the LOX gene family, LOXL3 was found to be expressed at low levels in all sections of the central nervous system, with highest levels in spinal cord and medulla. By Northern blot analysis, Maki and Kivirikko (2001) detected highest expression of a 3.1-kb LOXL3 transcript in placenta, heart, ovary, testis, small intestine, and spleen. Jourdan-Le Saux et al. (2001) determined that

the LOXL3 gene contains 14 exons and spans approximately 21 kb. By EST database searching, they identified splice variants lacking exons 5 and 8

[2653] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[2654] Jourdan-Le Saux, C.; Tomsche, A.; Ujfalusi, A.; Jia, L.; Csiszar, K. : Central nervous system, uterus, heart, and leukocyte expression of the LOXL3 gene, encoding a novel lysyl oxidase-like protein. Genomics 74: 211-218, 2001. ; and

[2655] Jourdan-Le Saux, C.; Tomsche, A.; Ujfalusi, A.; Jia, L.; Csiszar, K. : Central nervous system, uterus, heart, and leukocyte expression of the LOXL3 gene, encoding a novel lysyl oxidase-lik.

[2656] Further studies establishing the function and utilities of LOXL3 are found in John Hopkins OMIM database record ID 607163, and in cited publications numbered 1328-1329 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. DKFZp547I014 (Accession NM_020217) is another VGAM95 host target gene. DKFZp547I014 BINDING SITE is HOST TARGET binding site found in the 5` untranslated

region of mRNA encoded by DKFZp547I014, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp547I014 BINDING SITE, designated SEQ ID:1901, to the nucleotide sequence of VGAM95 RNA, herein designated VGAM RNA, also designated SEQ ID:430.

[2657] Another function of VGAM95 is therefore inhibition of DKFZp547I014 (Accession NM_020217). Accordingly, utilities of VGAM95 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp547I014. Spir-1 (Accession XM_035640) is another VGAM95 host target gene. Spir-1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by Spir-1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of Spir-1 BINDING SITE, designated SEQ ID:2699, to the nucleotide sequence of VGAM95 RNA, herein designated VGAM RNA, also designated SEQ ID:430.

[2658] Another function of VGAM95 is therefore inhibition of Spir-1 (Accession XM_035640). Accordingly, utilities of

VGAM95 include diagnosis, prevention and treatment of diseases and clinical conditions associated with Spir-1.

Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 96 (VGAM96) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[2659] VGAM96 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM96 was detected is described hereinabove with reference to Figs. 1-8.

[2660] VGAM96 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus. VGAM96 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[2661] VGAM96 gene encodes a VGAM96 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM96 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM96 precursor RNA is designated SEQ ID:82, and is provided hereinbelow with reference to the

sequence listing part. Nucleotide sequence SEQ ID:82 is located at position 30764 relative to the genome of Vaccinia Virus.

[2662] VGAM96 precursor RNA folds onto itself, forming VGAM96 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[2663] An enzyme complex designated DICER COMPLEX, `dices` the VGAM96 folded precursor RNA into VGAM96 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 90%) nucleotide sequence of VGAM96 RNA is designated SEQ ID:431, and is provided hereinbelow with reference to the sequence listing part.

[2664] VGAM96 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM96 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM96 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[2665] VGAM96 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM96 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM96 RNA is an accurate or a partial inverted-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM96 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of

a VGAM96 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR and 5' UTR regions.

[2666] The complementary binding of VGAM96 RNA, herein designated VGAM RNA, to host target binding sites on VGAM96 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM96 host target RNA into VGAM96 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[2667] It is appreciated that VGAM96 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM96 host target genes. The mRNA of each one of this plurality of VGAM96 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM96 RNA, herein designated VGAM RNA, and which when bound by VGAM96 RNA causes inhibition of translation of respective one or more VGAM96

host target proteins.

[2668] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM96 gene, herein designated VGAM GENE, on one or more VGAM96 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[2669] It is yet further appreciated that a function of VGAM96 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM96 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM96 correlate

with, and may be deduced from, the identity of the host target genes which VGAM96 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[2670] Nucleotide sequences of the VGAM96 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM96 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM96 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM96 are further described hereinbelow with reference to Table 1.

[2671] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM96 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM96 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[2672] As mentioned hereinabove with reference to Fig. 1, a function of VGAM96 gene, herein designated VGAM is inhibition of expression of VGAM96 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM96 correlate with, and may be deduced from, the

identity of the target genes which VGAM96 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[2673] Glutamate-cysteine Ligase, Catalytic Subunit (GCLC, Accession NM_001498) is a VGAM96 host target gene. GCLC BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GCLC, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GCLC BINDING SITE, designated SEQ ID:833, to the nucleotide sequence of VGAM96 RNA, herein designated VGAM RNA, also designated SEQ ID:431.

[2674] A function of VGAM96 is therefore inhibition of Glutamate-cysteine Ligase, Catalytic Subunit (GCLC, Accession NM_001498). Accordingly, utilities of VGAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GCLC. FLJ21324 (Accession XM_165988) is another VGAM96 host target gene. FLJ21324 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ21324, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21324 BINDING SITE, designated SEQ ID:3513, to the nucleotide sequence of VGAM96 RNA, herein designated VGAM RNA, also designated SEQ ID:431.

[2675] Another function of VGAM96 is therefore inhibition of FLJ21324 (Accession XM_165988). Accordingly, utilities of VGAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21324. KIAA0193 (Accession NM_014766) is another VGAM96 host target gene. KIAA0193 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0193, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0193 BINDING SITE, designated SEQ ID:1543, to the nucleotide sequence of VGAM96 RNA, herein designated VGAM RNA, also designated SEQ ID:431.

[2676] Another function of VGAM96 is therefore inhibition of KIAA0193 (Accession NM_014766). Accordingly, utilities of VGAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA0193. LOC91097 (Accession XM_035977) is another VGAM96 host target gene. LOC91097 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC91097, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91097 BINDING SITE, designated SEQ ID:2705, to the nucleotide sequence of VGAM96 RNA, herein designated VGAM RNA, also designated SEQ ID:431.

[2677] Another function of VGAM96 is therefore inhibition of LOC91097 (Accession XM_035977). Accordingly, utilities of VGAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91097. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 97 (VGAM97) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[2678] VGAM97 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The

method by which VGAM97 was detected is described hereinabove with reference to Figs. 1–8.

[2679] VGAM97 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus. VGAM97 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[2680] VGAM97 gene encodes a VGAM97 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM97 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM97 precursor RNA is designated SEQ ID:83, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:83 is located at position 31794 relative to the genome of Vaccinia Virus.

[2681] VGAM97 precursor RNA folds onto itself, forming VGAM97 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate

or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[2682] An enzyme complex designated DICER COMPLEX, `dices` the VGAM97 folded precursor RNA into VGAM97 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 73%) nucleotide sequence of VGAM97 RNA is designated SEQ ID:432, and is provided hereinbelow with reference to the sequence listing part.

[2683] VGAM97 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM97 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM97 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[2684] VGAM97 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites lo-

cated in untranslated regions of VGAM97 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM97 RNA is an accurate or a partial inverted-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM97 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM97 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[2685] The complementary binding of VGAM97 RNA, herein designated VGAM RNA, to host target binding sites on VGAM97 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and

BINDING SITE III, inhibits translation of VGAM97 host target RNA into VGAM97 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[2686] It is appreciated that VGAM97 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM97 host target genes. The mRNA of each one of this plurality of VGAM97 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM97 RNA, herein designated VGAM RNA, and which when bound by VGAM97 RNA causes inhibition of translation of respective one or more VGAM97 host target proteins.

[2687] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM97 gene, herein designated VGAM GENE, on one or more VGAM97 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only

for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[2688] It is yet further appreciated that a function of VGAM97 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM97 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM97 correlate with, and may be deduced from, the identity of the host target genes which VGAM97 binds and inhibits, and the function of these host target genes, as elaborated herein-below.

[2689] Nucleotide sequences of the VGAM97 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM97 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM97 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM97 are further de-

scribed hereinbelow with reference to Table 1.

[2690] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM97 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM97 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[2691] As mentioned hereinabove with reference to Fig. 1, a function of VGAM97 gene, herein designated VGAM is inhibition of expression of VGAM97 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM97 correlate with, and may be deduced from, the identity of the target genes which VGAM97 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[2692] A Disintegrin-like and Metalloprotease (reprolysin type) with Thrombospondin Type 1 Motif, 5 (aggrecanase-2) (ADAMTS5, Accession NM_007038) is a VGAM97 host target gene. ADAMTS5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ADAMTS5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or

BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ADAMTS5 BINDING SITE, designated SEQ ID:1353, to the nucleotide sequence of VGAM97 RNA, herein designated VGAM RNA, also designated SEQ ID:432.

[2693] A function of VGAM97 is therefore inhibition of A Disintegrin-like and Metalloprotease (reprolysin type) with Thrombospondin Type 1 Motif, 5 (aggrecanase-2) (ADAMTS5, Accession NM_007038), a gene which cleaves aggrecan, a cartilage proteoglycan, and may be involved in its turnover. Accordingly, utilities of VGAM97 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADAMTS5. The function of ADAMTS5 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM49.BCRP2 (Accession XM_031102) is another VGAM97 host target gene. BCRP2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BCRP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BCRP2 BINDING SITE,

designated SEQ ID:2633, to the nucleotide sequence of VGAM97 RNA, herein designated VGAM RNA, also designated SEQ ID:432.

[2694] Another function of VGAM97 is therefore inhibition of BCRP2 (Accession XM_031102). Accordingly, utilities of VGAM97 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BCRP2. Interleukin 13 Receptor, Alpha 1 (IL13RA1, Accession NM_001560) is another VGAM97 host target gene. IL13RA1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by IL13RA1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IL13RA1 BINDING SITE, designated SEQ ID:835, to the nucleotide sequence of VGAM97 RNA, herein designated VGAM RNA, also designated SEQ ID:432.

[2695] Another function of VGAM97 is therefore inhibition of Interleukin 13 Receptor, Alpha 1 (IL13RA1, Accession NM_001560), a gene which binds il-13 with a low affinity. together with il-4r- alpha can form a functional receptor for il-13. Accordingly, utilities of VGAM97 include diag-

nosis, prevention and treatment of diseases and clinical conditions associated with IL13RA1. The function of IL13RA1 has been established by previous studies. Interleukin-4 (IL4; 147780) and interleukin-13 (IL13; 147683) are 2 cytokines that are secreted by activated T cells and have similar effects on monocytes and B cells. Zurawski et al. (1993) demonstrated that the IL4 receptor (OMIM Ref. No. 147781) is a complex of at least 2 components. They described a mutant form of human IL4 that competitively antagonizes both human IL4 and human IL13. The amino acid sequences of IL4 and IL13 are approximately 30% homologous, and circular dichroism spectroscopy demonstrates that both proteins have a highly alpha-helical structure. IL13 competitively inhibited binding of IL4 to functional human IL4 receptors expressed on a cell line that responds to both IL4 and IL13. The binding of IL4 to an IL4-responsive cell line that does not respond to IL13, and the binding of IL4 to cloned IL4R ligand binding protein expressed on heterologous cells, were not inhibited by IL13. The results demonstrated that IL4 and IL13 share a receptor component that is important for signal transduction. Hilton et al. (1996) reviewed these and other data suggesting a model of IL4 and IL13 receptor composition

and function Heinzmann et al. (2000) determined that a variant of human IL13 (OMIM Ref. No. 147683), arg110 to gln (OMIM Ref. No. A4464G), associated with asthma in case-control populations from Britain and Japan (peak odds ratio (OR) = 2.31, 95% confidence interval, 1.33 – 4.00); the variant also predicted asthma and higher serum IL13 levels in a general, Japanese pediatric population. The authors referred to this variant as gln110 to arg. Immunohistochemistry demonstrated that both subunits of IL13R are prominently expressed in bronchial epithelium and smooth muscle from asthmatic subjects. Detailed molecular modeling analyses indicated that residue 110 of IL13 is important in the internal constitution of the ligand and crucial in ligand-receptor interaction. A noncoding variant of IL13R-alpha 1, 1398A-G, associated primarily with high IgE levels (OR = 3.38 in males, 1.10 in females) rather than asthma

[2696] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[2697] Hilton, D. J.; Zhang, J.-G.; Metcalf, D.; Alexander, W. S.; Nicola, N. A.; Willson, T. A. : Cloning and characterization of a binding subunit of the interleukin 13 receptor that is

also a component of the interleukin 4 receptor. Proc. Nat. Acad. Sci. 93: 497–501, 1996. ; and

[2698] Heinzmann, H.; Mao, X.-Q.; Akaiwa, M.; Kreomer, R. T.; Gao, P.-S.; Ohshima, K.; Umeshita, R.; Abe, Y.; Braun, S.; Yamashita, T.; Roberts, M. H.; Sugimoto, R.; and 20 others : Genetic var.

[2699] Further studies establishing the function and utilities of IL13RA1 are found in John Hopkins OMIM database record ID 300119, and in cited publications numbered 2434–2435, 144, 243 and 2669 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Interleukin 1, Alpha (IL1A, Accession XM_031221) is another VGAM97 host target gene. IL1A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by IL1A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IL1A BINDING SITE, designated SEQ ID:2634, to the nucleotide sequence of VGAM97 RNA, herein designated VGAM RNA, also designated SEQ ID:432.

[2700] Another function of VGAM97 is therefore inhibition of Interleukin 1, Alpha (IL1A, Accession XM_031221), a gene

which stimulates thymocyte proliferation by inducing il-2 release, b-cell maturation and proliferation, and fibroblast growth factor activity. Accordingly, utilities of VGAM97 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IL1A. The function of IL1A has been established by previous studies. There are 2 structurally distinct forms of IL1: IL1(alpha), which is the acidic form with pI5, and IL1(beta) (IL1B; 147720), the neutral form with pI7. Both are 17-kD proteins coded by separate genes. The IL1A gene has 10,206 bp with 7 exons and 6 introns (Furutani et al., 1986). By Southern transfer analysis of DNAs from human-rodent somatic cell hybrids, Modi et al. (1988) assigned the IL1A gene to chromosome 2. Regional localization to 2q13-q21 was achieved by in situ hybridization. Lafage et al. (1989) confirmed assignment to 2q13 by in situ hybridization. The IL1A and IL1B proteins, which are synthesized by a variety of cell types including activated macrophages, keratinocytes, stimulated B lymphocytes, and fibroblasts, are potent mediators of inflammation and immunity. Lord et al. (1991) demonstrated that both the alpha and beta forms, but particularly the beta form, are transcribed in polymorphonuclear leukocytes stimulated with LPS. Both

IL1A and IL1B stimulate osteoclast activity in vitro and are potent bone resorbing factors. Sabatino et al. (1988) studied the effects of 72-hour subcutaneous infusions of interleukins 1-alpha and -beta on plasma, calcium, and bone morphology. Both interleukins 1 caused a marked, dose-dependent increase in plasma calcium. Increased numbers of osteoclasts and bone resorption surfaces were observed on quantitative histomorphometry of bone. The results suggest a role for IL1 in the modulation of extra-cellular fluid calcium homeostasis. Hogquist et al. (1991) demonstrated that interleukin-1 is involved in apoptosis (cell death). Both the alpha and the beta forms are released as a consequence of cell injury regardless of the insult Ki et al. (2001) analyzed the IL1A -889 C/T genotype of 126 Korean patients with AD and found no significant difference in allele frequencies between patients and controls. Interestingly, there were no T/T homozygotes in the entire study population

[2701] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[2702] Hogquist, K. A.; Nett, M. A.; Unanue, E. R.; Chaplin, D. D. : Interleukin 1 is processed and released during apoptosis.

Proc. Nat. Acad. Sci. 88: 8485–8489, 1991. ; and

[2703] Ki, C.-S.; Na, D. L.; Kim, D. K.; Kim, H. J.; Kim, J.-W. : Lack of association of the interleukin-1-alpha gene polymorphism with Alzheimer's disease in a Korean population. (Letter) Ann.

[2704] Further studies establishing the function and utilities of IL1A are found in John Hopkins OMIM database record ID 147760, and in cited publications numbered 923–938, 920–922, 939, 256 and 2627–2630 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. ISL1 Transcription Factor, LIM/homeodomain, (islet-1) (ISL1, Accession NM_002202) is another VGAM97 host target gene. ISL1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ISL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ISL1 BINDING SITE, designated SEQ ID:906, to the nucleotide sequence of VGAM97 RNA, herein designated VGAM RNA, also designated SEQ ID:432.

[2705] Another function of VGAM97 is therefore inhibition of ISL1 Transcription Factor, LIM/homeodomain, (islet-1) (ISL1,

Accession NM_002202), a gene which binds to one of the cis-acting domain of the insulin gene enhancer. Accordingly, utilities of VGAM97 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ISL1. The function of ISL1 has been established by previous studies. Because insulin deficiency, either relative or absolute, is a cardinal feature of noninsulin-dependent diabetes mellitus (NIDDM; 125853), Tanizawa et al. (1994) investigated the possible involvement of mutations in genes that regulate insulin production. Rat Isl1 was the first insulin enhancer-binding protein to be isolated; Tanizawa et al. (1994) used the rat gene to isolate a partial human ISL1 cDNA and subsequently to isolate genomic clones. A simple sequence repeat was found in the ISL1 gene. PCR amplification of this region of genomic DNA revealed 12 alleles in St. Louis African-Americans (heterozygosity = 0.87), 14 alleles in black Nigerians (heterozygosity = 0.89), 8 alleles in Japanese (heterozygosity = 0.69), and 8 alleles in Caucasians (heterozygosity = 0.81). Allelic frequencies in the gene did not differ between patients with NIDDM and nondiabetic control subjects in 2 black populations Shimomura et al. (2000) found a nonsense mutation (Q310X) in the

ISL1 gene in a Japanese patient with type II diabetes and a strong family history. The mutation led to decreased activity of the islet-1 transcription factor and thus may have been pathogenic. However, as indicated by Fajans et al. (2001), additional genetic and clinical studies were required to determine whether mutations in ISL1 are the cause of another subtype of MODY

[2706] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[2707] Shimomura, H.; Sanke, T.; Hanabusa, T.; Tsunoda, K.; Furuta, H.; Nanjo, K. : Nonsense mutation of islet-1 gene (Q310X) found in a type 2 diabetic patient with a strong family history. Diabetes 49: 1597-1600, 2000. ; and

[2708] Tanizawa, Y.; Riggs, A. C.; Dagogo-Jack, S.; Vaxillaire, M.; Froguel, P.; Liu, L.; Donis-Keller, H.; Permutt, M. A. : Isolation of the human LIM/homeodomain gene islet-1 and identificat.

[2709] Further studies establishing the function and utilities of ISL1 are found in John Hopkins OMIM database record ID 600366, and in cited publications numbered 2810 listed in the bibliography section hereinbelow, which are also hereby incorporated by refer-

ence. Microphthalmia-associated Transcription Factor (MITF, Accession NM_000248) is another VGAM97 host target gene. MITF BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MITF, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MITF BINDING SITE, designated SEQ ID:721, to the nucleotide sequence of VGAM97 RNA, herein designated VGAM RNA, also designated SEQ ID:432.

[2710] Another function of VGAM97 is therefore inhibition of Microphthalmia-associated Transcription Factor (MITF, Accession NM_000248), a gene which waardenburg syndrome type 2a, tietz syndrome. Accordingly, utilities of VGAM97 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MITF. The function of MITF has been established by previous studies. Tassabehji et al. (1995) concluded that Waardenburg syndrome type II is heterogeneous, with about 20% of cases caused by mutations in MITF. In the mouse, mi mutations can be dominant or recessive. Dominant alleles are believed to work by a dominant-negative effect. A protein with intact helix-loop-helix and zipper sequences but de-

fective DNA binding or transactivation domains sequesters the normal gene products in inactive dimers. Mutations that prevent dimerization are recessive. Tassabehji et al. (1995) noted that most of the mouse mutations are recessive and most of the human mutations in MITF appear to be dominant. They concluded that MITF is another example of a gene like RET (OMIM Ref. No. 164761) or PAX3 in which humans are more sensitive than mice to gene dosage effects in heterozygotes. Mutations in MITF and PAX3, encoding transcription factors, are responsible for Waardenburg syndrome type II and WS1/WS3, respectively. Tachibana et al. (1996) showed that MITF transactivates the gene for tyrosinase (see OMIM Ref. No. 606933), a key enzyme for melanogenesis, and is critically involved in melanocyte differentiation. Absence of melanocytes affects pigmentation in the skin, hair, and eyes, and hearing function in the cochlea. Therefore, hypopigmentation and hearing loss in WS2 are likely to be the results of an anomaly of melanocyte differentiation caused by MITF mutations. However, the molecular mechanism by which PAX3 mutations cause the auditory-pigmentary symptoms in WS1/WS3 had not been explained. Watanabe et al. (1998) showed that PAX3, a transcription factor with a

paired domain and a homeodomain, transactivates the MITF promoter. They further showed that PAX3 proteins associated with WS1 in either the paired domain or the homeodomain failed to recognize and transactivate the MITF promoter. These results provided evidence that PAX3 directly regulates MITF, and suggested that the failure of this regulation due to PAX3 mutations causes the auditory-pigmentary symptoms in at least some individuals with WS1.

- [2713] Tassabehji, M.; Newton, V. E.; Liu, X.-Z.; Brady, A.; Donnai, D.; Krajewska-Walasek, M.; Murday, V.; Norman, A.; Obersztyn, E.; Reardon, W.; Rice, J. C.; Trembath, R.; Wieacker, P.; Wh.
- [2714] Further studies establishing the function and utilities of MITF are found in John Hopkins OMIM database record ID

156845, and in cited publications numbered 786, 2814–789, 525, 790, 2815, 2470, 2816–2475, 725, 247 and 2817–2478 listed in the bibliography section herein–below, which are also hereby incorporated by reference. Neutrophil Cytosolic Factor 2 (65kDa, chronic granulomatous disease, autosomal 2) (NCF2, Accession NM_000433) is another VGAM97 host target gene. NCF2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NCF2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NCF2 BINDING SITE, designated SEQ ID:742, to the nucleotide sequence of VGAM97 RNA, herein designated VGAM RNA, also designated SEQ ID:432.

[2715] Another function of VGAM97 is therefore inhibition of Neutrophil Cytosolic Factor 2 (65kDa, chronic granulomatous disease, autosomal 2) (NCF2, Accession NM_000433). Accordingly, utilities of VGAM97 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NCF2. Neural Precursor Cell Expressed, Developmentally Down–regulated 4–like (NEDD4L, Accession NM_015277) is another VGAM97 host

target gene. NEDD4L BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NEDD4L, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NEDD4L BINDING SITE, designated SEQ ID:1618, to the nucleotide sequence of VGAM97 RNA, herein designated VGAM RNA, also designated SEQ ID:432.

[2716] Another function of VGAM97 is therefore inhibition of Neural Precursor Cell Expressed, Developmentally Down-regulated 4-like (NEDD4L, Accession NM_015277), a gene which may play a role in the regulation of epithelial sodium channel function. Accordingly, utilities of VGAM97 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NEDD4L. The function of NEDD4L has been established by previous studies. Using cosmid from a human chromosome 18-specific library, Chen et al. (2001) used exon trapping and cDNA cloning to identify a gene homologous to NEDD4. The full-length cDNA sequence of 3,246 bp, obtained by RACE, contains an open reading frame of 2,562 nucleotides. The deduced 854-amino acid polypeptide was

predicted to contain 4 WW domains and an HECT ubiquitin–protein ligase domain, highly conserved features in the NEDD4 gene family. The NEDD4L gene has 97% and 62% amino acid sequence identity to mouse Nedd4–2 and human NEDD4 genes, respectively. By expression analysis, a 3.4–kb band was observed in heart and muscle, while a 3.2–kb band and/or an additional 3.6–kb band were seen in other tissues examined. An alternative splicing event involving exon 12 of 60 bp was observed, the shorter allele being predominantly present in brain and lymphocytes, while the longer allele was strongly expressed in kidney and placenta. Since the NEDD4L gene mapped to the region of 18q21 showing linkage evidence for a susceptibility locus for bipolar affective disorder (OMIM Ref. No. 125480), Chen et al. (2001) screened the NEDD4L gene for mutations in 3 unrelated bipolar I probands and their parents, but no mutations were detected. Due to the potential role of NEDD4L in regulating the epithelial sodium channel (ENaC; OMIM Ref. No. 600228), Chen et al. (2001) proposed it a candidate gene for autosomal dominant orthostatic hypotensive disorder (OMIM Ref. No. 143850), mapped to 18q21. Erdeniz and Rothstein (2000) found that the ubiquitination domain of KIAA0439 shares

homology with the *S. cerevisiae* Rsp5, a ubiquitin–protein ligase. They analyzed Rsp5 mutant strains and concluded that Rsp5 may be involved in the degradation of the single–stranded DNA–binding protein Rfa1, thereby linking ubiquitin–dependent protein degradation to the replication–recombination machinery.

[2717] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[2718] Chen, H.; Ross, C. A.; Wang, N.; Huo, Y.; MacKinnon, D. F.; Potash, J. B.; Simpson, S. G.; McMahon, F. J.; DePaulo, J. R., Jr.; McInnis, M. G. : NEDD4L on human chromosome 18q21 has multiple forms of transcripts and is a homologue of the mouse Nedd4–2 gene. *Europ. J. Hum. Genet.* 9: 922–930, 2001. ; and

[2719] Erdeniz, N.; Rothstein, R. : Rsp5, a ubiquitin–protein ligase, is involved in degradation of the single–stranded–DNA binding protein Rfa1 in *Saccharomyces cerevisiae*. *Molec. Cell. Bio.*

[2720] Further studies establishing the function and utilities of NEDD4L are found in John Hopkins OMIM database record ID 606384, and in cited publications numbered 1505–150 and 1712 listed in the bibliography section hereinbelow,

which are also hereby incorporated by reference. Nuclear Receptor Subfamily 3, Group C, Member 1 (glucocorticoid receptor) (NR3C1, Accession NM_000176) is another VGAM97 host target gene. NR3C1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NR3C1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NR3C1 BINDING SITE, designated SEQ ID:717, to the nucleotide sequence of VGAM97 RNA, herein designated VGAM RNA, also designated SEQ ID:432.

[2721] Another function of VGAM97 is therefore inhibition of Nuclear Receptor Subfamily 3, Group C, Member 1 (glucocorticoid receptor) (NR3C1, Accession NM_000176). Accordingly, utilities of VGAM97 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NR3C1. Pyruvate Dehydrogenase Kinase, Isoenzyme 4 (PDK4, Accession XM_173198) is another VGAM97 host target gene. PDK4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PDK4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE

II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PDK4 BINDING SITE, designated SEQ ID:3733, to the nucleotide sequence of VGAM97 RNA, herein designated VGAM RNA, also designated SEQ ID:432.

[2722] Another function of VGAM97 is therefore inhibition of Pyruvate Dehydrogenase Kinase, Isoenzyme 4 (PDK4, Accession XM_173198). Accordingly, utilities of VGAM97 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PDK4. Presenilin 1 (Alzheimer disease 3) (PSEN1, Accession NM_007319) is another VGAM97 host target gene. PSEN1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PSEN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PSEN1 BINDING SITE, designated SEQ ID:1393, to the nucleotide sequence of VGAM97 RNA, herein designated VGAM RNA, also designated SEQ ID:432.

[2723] Another function of VGAM97 is therefore inhibition of Presenilin 1 (Alzheimer disease 3) (PSEN1, Accession NM_007319). Accordingly, utilities of VGAM97 include di-

agnosis, prevention and treatment of diseases and clinical conditions associated with PSEN1. Recombination Activating Gene 1 (RAG1, Accession NM_000448) is another VGAM97 host target gene. RAG1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RAG1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAG1 BINDING SITE, designated SEQ ID:746, to the nucleotide sequence of VGAM97 RNA, herein designated VGAM RNA, also designated SEQ ID:432.

[2724] Another function of VGAM97 is therefore inhibition of Recombination Activating Gene 1 (RAG1, Accession NM_000448). Accordingly, utilities of VGAM97 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAG1. Synaptogyrin 1 (SYNGR1, Accession NM_004711) is another VGAM97 host target gene. SYNGR1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SYNGR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of SYNGR1 BINDING SITE, designated SEQ ID:1148, to the nucleotide sequence of VGAM97 RNA, herein designated VGAM RNA, also designated SEQ ID:432.

[2725] Another function of VGAM97 is therefore inhibition of Synaptogyrin 1 (SYNGR1, Accession NM_004711), a gene which belongs to transmembrane synaptic vesicle protein and may function in membrane recycling. Accordingly, utilities of VGAM97 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SYNGR1. The function of SYNGR1 has been established by previous studies. Rat synaptogyrin, or RAT-SYNGR1, is an integral membrane protein associated with presynaptic vesicles in neuronal cells. See SYNGR2 (OMIM Ref. No. 603926). As part of an effort to sequence the long arm of human chromosome 22, Kedra et al. (1998) identified the human homolog of RATSNGR1, synaptogyrin-1 (OMIM Ref. No. SYNGR1). By a combination of EST database searching and library screening, the authors isolated cDNAs corresponding to 3 alternatively spliced transcripts, which they designated SYNGR1a-c. The predicted 1a, 1b, and 1c proteins contain 234, 191, and 192 amino acids, respectively. Northern blot analysis revealed that

the 4.5-kb SYNGR1a mRNA is expressed at high levels in brain. The other transcript forms are expressed at low levels in nonneuronal tissues. In situ hybridization to embryonic and adult mouse tissues confirmed that SYNGR1a, the most abundant transcript form, shows predominantly neuronal expression. Kedra et al. (1998) also identified cDNAs encoding the related human proteins SYNGR2 and SYNGR3 (OMIM Ref. No. 603927) and mouse *Syng1b*. Like RATSNGR1, the mouse and human synaptogyrin family members contain 4 membrane-spanning domains. The conserved central portion of SYNGR1a shares 54%, 61%, and 92% identity with that of SYNGR2, SYNGR3, and RATSNGR1, respectively. Animal model experiments lend further support to the function of SYNGR1. Using gene targeting, Janz et al. (1999) generated mice lacking *Syng1*. They bred these *Syng1* knockout mice against *Syp* (OMIM Ref. No. 313475) knockout mice generated by McMahon et al. (1996) to create double knockout mice deficient in both *Syp* and *Syng1*. Both single and double knockout mice were viable and fertile. Morphologic and biochemical analysis showed that the architecture and composition of synapses were unaltered in the brains of *Syng1* single knockout and *Syng1/Syp* double knockout

mutant mice. Electrophysiologic recordings in the hippocampal CA1 region revealed that short- and long-term synaptic plasticity was severely reduced in the Syngn1/Syp double knockout mice without changes in the fundamental release apparatus, vesicle cycling, or release probability. Janz et al. (1999) concluded that Syngn1 and Syp perform essential and redundant functions in synaptic plasticity without being required for synaptic transmission as such.

[2726] It is appreciated that the abovementioned animal model for SYNGR1 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[2727] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[2728] Janz, R.; Sudhof, T. C.; Hammer, R. E.; Unni, V.; Siegelbaum, S. A.; Bolshakov, V. Y. : Essential roles in synaptic plasticity for synaptogyrin I and synaptophysin I. *Neuron* 24: 687–700, 1999. ; and

[2729] Kedra, D.; Pan, H.-Q.; Seroussi, E.; Fransson, I.; Guilbaud, C.; Collins, J. E.; Dunham, I.; Blennow, E.; Roe, B. A.; Piehl, F.; Dumanski, J. P. : Characterization of the human

synapto.

- [2730] Further studies establishing the function and utilities of SYNGR1 are found in John Hopkins OMIM database record ID 603925, and in cited publications numbered 185 and 1858 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. TOX (Accession NM_014729) is another VGAM97 host target gene. TOX BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by TOX, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TOX BINDING SITE, designated SEQ ID:1534, to the nucleotide sequence of VGAM97 RNA, herein designated VGAM RNA, also designated SEQ ID:432.
- [2731] Another function of VGAM97 is therefore inhibition of TOX (Accession NM_014729). Accordingly, utilities of VGAM97 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TOX. Transient Receptor Potential Cation Channel, Subfamily C, Member 6 (TRPC6, Accession NM_004621) is another VGAM97 host target gene. TRPC6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded

by TRPC6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRPC6 BINDING SITE, designated SEQ ID:1135, to the nucleotide sequence of VGAM97 RNA, herein designated VGAM RNA, also designated SEQ ID:432.

[2732] Another function of VGAM97 is therefore inhibition of Transient Receptor Potential Cation Channel, Subfamily C, Member 6 (TRPC6, Accession NM_004621), a gene which has calcium channel activity. Accordingly, utilities of VGAM97 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRPC6. The function of TRPC6 has been established by previous studies. TRPCs, mammalian homologs of the *Drosophila* transient receptor potential (trp) protein, are ion channels that are thought to mediate capacitative calcium entry into the cell. Using a PCR-based strategy, Hofmann et al. (1999) isolated cDNAs encoding TRPC6, a novel member of the TRPC family. The predicted 931-amino acid protein shares 93% identity with mouse *Trpc6*. The authors found that TRPC6 is a nonselective cation channel that is activated by diacylglycerol (DAG) in a membrane-delimited

fashion, independently of protein kinase C. Although TRPC3 (OMIM Ref. No. 602345), the closest structural relative of TRPC6, is activated in the same manner, human TRPC1 and mouse *Trpc4* (OMIM Ref. No. 603651) and *Trpc5* (OMIM Ref. No. 300334) were unresponsive to DAG. The authors suggested that TRPC3 and TRPC6 represent the first members of a new functional family of second-messenger-operated cation channels that are activated by DAG. Northern blot analysis revealed that TRPC6 is expressed primarily in placenta, lung, spleen, ovary, and small intestine. By FISH, D'Esposito et al. (1998) mapped the TRPC6 gene to chromosome 11q21-q22.

[2733] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[2734] Hofmann, T.; Obukhov, A. G.; Schaefer, M.; Harteneck, C.; Gudermann, T.; Schultz, G. : Direct activation of human TRPC6 and TRPC3 channels by diacylglycerol. *Nature* 397: 259-263, 1999. ; and

[2735] D'Esposito, M.; Strazzullo, M.; Cuccurese, M.; Spalluto, C.; Rocchi, M.; D'Urso, M.; Ciccodicola, A. : Identification and assignment of the human transient receptor potential channel 6 gene.

[2736] Further studies establishing the function and utilities of TRPC6 are found in John Hopkins OMIM database record ID 603652, and in cited publications numbered 1344–1345 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. AF9Q34 (Accession NM_032552) is another VGAM97 host target gene. AF9Q34 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by AF9Q34, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AF9Q34 BINDING SITE, designated SEQ ID:2258, to the nucleotide sequence of VGAM97 RNA, herein designated VGAM RNA, also designated SEQ ID:432.

[2737] Another function of VGAM97 is therefore inhibition of AF9Q34 (Accession NM_032552). Accordingly, utilities of VGAM97 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AF9Q34. Complement Component 1, Q Subcomponent, Receptor 1 (C1QR1, Accession NM_012072) is another VGAM97 host target gene. C1QR1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA en-

coded by C1QR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C1QR1 BINDING SITE, designated SEQ ID:1402, to the nucleotide sequence of VGAM97 RNA, herein designated VGAM RNA, also designated SEQ ID:432.

[2738] Another function of VGAM97 is therefore inhibition of Complement Component 1, Q Subcomponent, Receptor 1 (C1QR1, Accession NM_012072). Accordingly, utilities of VGAM97 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C1QR1. FLJ10193 (Accession NM_018019) is another VGAM97 host target gene. FLJ10193 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10193, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10193 BINDING SITE, designated SEQ ID:1775, to the nucleotide sequence of VGAM97 RNA, herein designated VGAM RNA, also designated SEQ ID:432.

[2739] Another function of VGAM97 is therefore inhibition of

FLJ10193 (Accession NM_018019). Accordingly, utilities of VGAM97 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10193. FLJ10989 (Accession NM_018292) is another VGAM97 host target gene. FLJ10989 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10989, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10989 BINDING SITE, designated SEQ ID:1810, to the nucleotide sequence of VGAM97 RNA, herein designated VGAM RNA, also designated SEQ ID:432.

[2740] Another function of VGAM97 is therefore inhibition of FLJ10989 (Accession NM_018292). Accordingly, utilities of VGAM97 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10989. FLJ20700 (Accession NM_017932) is another VGAM97 host target gene. FLJ20700 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20700, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of FLJ20700 BINDING SITE, designated SEQ ID:1767, to the nucleotide sequence of VGAM97 RNA, herein designated VGAM RNA, also designated SEQ ID:432.

[2741] Another function of VGAM97 is therefore inhibition of FLJ20700 (Accession NM_017932). Accordingly, utilities of VGAM97 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20700. FLJ31101 (Accession NM_017964) is another VGAM97 host target gene. FLJ31101 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ31101, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ31101 BINDING SITE, designated SEQ ID:1772, to the nucleotide sequence of VGAM97 RNA, herein designated VGAM RNA, also designated SEQ ID:432.

[2742] Another function of VGAM97 is therefore inhibition of FLJ31101 (Accession NM_017964). Accordingly, utilities of VGAM97 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ31101. KIAA0252 (Accession XM_031646) is another VGAM97

host target gene. KIAA0252 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0252, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0252 BINDING SITE, designated SEQ ID:2638, to the nucleotide sequence of VGAM97 RNA, herein designated VGAM RNA, also designated SEQ ID:432.

[2743] Another function of VGAM97 is therefore inhibition of KIAA0252 (Accession XM_031646). Accordingly, utilities of VGAM97 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0252. KIAA0416 (Accession NM_015564) is another VGAM97 host target gene. KIAA0416 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0416, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0416 BINDING SITE, designated SEQ ID:1638, to the nucleotide sequence of VGAM97 RNA, herein designated VGAM RNA, also designated SEQ ID:432.

[2744] Another function of VGAM97 is therefore inhibition of KIAA0416 (Accession NM_015564). Accordingly, utilities of VGAM97 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0416. KIAA0445 (Accession NM_014675) is another VGAM97 host target gene. KIAA0445 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA0445, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0445 BINDING SITE, designated SEQ ID:1519, to the nucleotide sequence of VGAM97 RNA, herein designated VGAM RNA, also designated SEQ ID:432.

[2745] Another function of VGAM97 is therefore inhibition of KIAA0445 (Accession NM_014675). Accordingly, utilities of VGAM97 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0445. KIAA0493 (Accession XM_034717) is another VGAM97 host target gene. KIAA0493 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA0493, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0493 BINDING SITE, designated SEQ ID:2683, to the nucleotide sequence of VGAM97 RNA, herein designated VGAM RNA, also designated SEQ ID:432.

[2746] Another function of VGAM97 is therefore inhibition of KIAA0493 (Accession XM_034717). Accordingly, utilities of VGAM97 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0493. KIAA0753 (Accession NM_014804) is another VGAM97 host target gene. KIAA0753 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0753, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0753 BINDING SITE, designated SEQ ID:1553, to the nucleotide sequence of VGAM97 RNA, herein designated VGAM RNA, also designated SEQ ID:432.

[2747] Another function of VGAM97 is therefore inhibition of KIAA0753 (Accession NM_014804). Accordingly, utilities of VGAM97 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA0753. KIAA0781 (Accession XM_041314) is another VGAM97 host target gene. KIAA0781 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0781, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0781 BINDING SITE, designated SEQ ID:2794, to the nucleotide sequence of VGAM97 RNA, herein designated VGAM RNA, also designated SEQ ID:432.

[2748] Another function of VGAM97 is therefore inhibition of KIAA0781 (Accession XM_041314). Accordingly, utilities of VGAM97 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0781. KIAA0825 (Accession XM_027906) is another VGAM97 host target gene. KIAA0825 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0825, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0825 BINDING SITE, designated SEQ ID:2589, to the nucleotide sequence of VGAM97 RNA, herein designated

VGAM RNA, also designated SEQ ID:432.

[2749] Another function of VGAM97 is therefore inhibition of KIAA0825 (Accession XM_027906). Accordingly, utilities of VGAM97 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0825. KIAA0831 (Accession NM_014924) is another VGAM97 host target gene. KIAA0831 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0831, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0831 BINDING SITE, designated SEQ ID:1590, to the nucleotide sequence of VGAM97 RNA, herein designated VGAM RNA, also designated SEQ ID:432.

[2750] Another function of VGAM97 is therefore inhibition of KIAA0831 (Accession NM_014924). Accordingly, utilities of VGAM97 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0831. KIAA1172 (Accession XM_047889) is another VGAM97 host target gene. KIAA1172 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1172, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1172 BINDING SITE, designated SEQ ID:2897, to the nucleotide sequence of VGAM97 RNA, herein designated VGAM RNA, also designated SEQ ID:432.

[2751] Another function of VGAM97 is therefore inhibition of KIAA1172 (Accession XM_047889). Accordingly, utilities of VGAM97 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1172. KR18 (Accession NM_033288) is another VGAM97 host target gene. KR18 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KR18, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KR18 BINDING SITE, designated SEQ ID:2325, to the nucleotide sequence of VGAM97 RNA, herein designated VGAM RNA, also designated SEQ ID:432.

[2752] Another function of VGAM97 is therefore inhibition of KR18 (Accession NM_033288). Accordingly, utilities of VGAM97 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with KR18. Mitogen-activated Protein Kinase 13 (MAPK13, Accession NM_002754) is another VGAM97 host target gene.

MAPK13 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MAPK13, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAPK13 BINDING SITE, designated SEQ ID:953, to the nucleotide sequence of VGAM97 RNA, herein designated VGAM RNA, also designated SEQ ID:432.

[2753] Another function of VGAM97 is therefore inhibition of Mitogen-activated Protein Kinase 13 (MAPK13, Accession NM_002754). Accordingly, utilities of VGAM97 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAPK13. MGC11386 (Accession NM_032933) is another VGAM97 host target gene. MGC11386 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC11386, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nu-

cleotide sequences of MGC11386 BINDING SITE, designated SEQ ID:2296, to the nucleotide sequence of VGAM97 RNA, herein designated VGAM RNA, also designated SEQ ID:432.

[2754] Another function of VGAM97 is therefore inhibition of MGC11386 (Accession NM_032933). Accordingly, utilities of VGAM97 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC11386. PRO0641 (Accession NM_014135) is another VGAM97 host target gene. PRO0641 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PRO0641, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO0641 BINDING SITE, designated SEQ ID:1477, to the nucleotide sequence of VGAM97 RNA, herein designated VGAM RNA, also designated SEQ ID:432.

[2755] Another function of VGAM97 is therefore inhibition of PRO0641 (Accession NM_014135). Accordingly, utilities of VGAM97 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO0641. PRO0902 (Accession NM_053057) is another VGAM97

host target gene. PRO0902 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PRO0902, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO0902 BINDING SITE, designated SEQ ID:2358, to the nucleotide sequence of VGAM97 RNA, herein designated VGAM RNA, also designated SEQ ID:432.

[2756] Another function of VGAM97 is therefore inhibition of PRO0902 (Accession NM_053057). Accordingly, utilities of VGAM97 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO0902. SMAP-5 (Accession NM_030799) is another VGAM97 host target gene. SMAP-5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SMAP-5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SMAP-5 BINDING SITE, designated SEQ ID:2168, to the nucleotide sequence of VGAM97 RNA, herein designated VGAM RNA, also designated SEQ ID:432.

[2757] Another function of VGAM97 is therefore inhibition of SMAP-5 (Accession NM_030799). Accordingly, utilities of VGAM97 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SMAP-5. Sprouty Homolog 4 (Drosophila) (SPRY4, Accession NM_030964) is another VGAM97 host target gene. SPRY4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SPRY4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SPRY4 BINDING SITE, designated SEQ ID:2177, to the nucleotide sequence of VGAM97 RNA, herein designated VGAM RNA, also designated SEQ ID:432.

[2758] Another function of VGAM97 is therefore inhibition of Sprouty Homolog 4 (Drosophila) (SPRY4, Accession NM_030964). Accordingly, utilities of VGAM97 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SPRY4. Ubiquitin Specific Protease 24 (USP24, Accession XM_165973) is another VGAM97 host target gene. USP24 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by USP24, corresponding to a HOST

TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of USP24 BINDING SITE, designated SEQ ID:3512, to the nucleotide sequence of VGAM97 RNA, herein designated VGAM RNA, also designated SEQ ID:432.

[2759] Another function of VGAM97 is therefore inhibition of Ubiquitin Specific Protease 24 (USP24, Accession XM_165973). Accordingly, utilities of VGAM97 include diagnosis, prevention and treatment of diseases and clinical conditions associated with USP24. Zinc Finger Protein 304 (ZNF304, Accession NM_020657) is another VGAM97 host target gene. ZNF304 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ZNF304, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF304 BINDING SITE, designated SEQ ID:1921, to the nucleotide sequence of VGAM97 RNA, herein designated VGAM RNA, also designated SEQ ID:432.

[2760] Another function of VGAM97 is therefore inhibition of Zinc Finger Protein 304 (ZNF304, Accession NM_020657). Ac-

cordingly, utilities of VGAM97 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF304. LOC121344 (Accession XM_058555) is another VGAM97 host target gene.

LOC121344 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC121344, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC121344 BINDING SITE, designated SEQ ID:2990, to the nucleotide sequence of VGAM97 RNA, herein designated VGAM RNA, also designated SEQ ID:432.

[2761] Another function of VGAM97 is therefore inhibition of LOC121344 (Accession XM_058555). Accordingly, utilities of VGAM97 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC121344. LOC144266 (Accession XM_084795) is another VGAM97 host target gene. LOC144266 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC144266, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC144266 BINDING SITE, designated SEQ ID:3065, to the nucleotide sequence of VGAM97 RNA, herein designated VGAM RNA, also designated SEQ ID:432.

[2762] Another function of VGAM97 is therefore inhibition of LOC144266 (Accession XM_084795). Accordingly, utilities of VGAM97 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144266. LOC145241 (Accession XM_031799) is another VGAM97 host target gene. LOC145241 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC145241, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145241 BINDING SITE, designated SEQ ID:2640, to the nucleotide sequence of VGAM97 RNA, herein designated VGAM RNA, also designated SEQ ID:432.

[2763] Another function of VGAM97 is therefore inhibition of LOC145241 (Accession XM_031799). Accordingly, utilities of VGAM97 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145241. LOC148545 (Accession XM_086226) is an-

other VGAM97 host target gene. LOC148545 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC148545, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148545 BINDING SITE, designated SEQ ID:3120, to the nucleotide sequence of VGAM97 RNA, herein designated VGAM RNA, also designated SEQ ID:432.

[2764] Another function of VGAM97 is therefore inhibition of LOC148545 (Accession XM_086226). Accordingly, utilities of VGAM97 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148545. LOC149073 (Accession XM_097577) is another VGAM97 host target gene. LOC149073 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC149073, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149073 BINDING SITE, designated SEQ ID:3305, to the nucleotide sequence of VGAM97 RNA, herein designated VGAM RNA, also designated SEQ ID:432.

[2765] Another function of VGAM97 is therefore inhibition of LOC149073 (Accession XM_097577). Accordingly, utilities of VGAM97 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149073. LOC149448 (Accession XM_097642) is another VGAM97 host target gene. LOC149448 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC149448, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149448 BINDING SITE, designated SEQ ID:3309, to the nucleotide sequence of VGAM97 RNA, herein designated VGAM RNA, also designated SEQ ID:432.

[2766] Another function of VGAM97 is therefore inhibition of LOC149448 (Accession XM_097642). Accordingly, utilities of VGAM97 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149448. LOC149579 (Accession XM_048743) is another VGAM97 host target gene. LOC149579 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC149579, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149579 BINDING SITE, designated SEQ ID:2907, to the nucleotide sequence of VGAM97 RNA, herein designated VGAM RNA, also designated SEQ ID:432.

[2767] Another function of VGAM97 is therefore inhibition of LOC149579 (Accession XM_048743). Accordingly, utilities of VGAM97 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149579. LOC152641 (Accession XM_087497) is another VGAM97 host target gene. LOC152641 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC152641, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152641 BINDING SITE, designated SEQ ID:3173, to the nucleotide sequence of VGAM97 RNA, herein designated VGAM RNA, also designated SEQ ID:432.

[2768] Another function of VGAM97 is therefore inhibition of LOC152641 (Accession XM_087497). Accordingly, utilities of VGAM97 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC152641. LOC169966 (Accession XM_093010) is another VGAM97 host target gene. LOC169966 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC169966, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC169966 BINDING SITE, designated SEQ ID:3253, to the nucleotide sequence of VGAM97 RNA, herein designated VGAM RNA, also designated SEQ ID:432.

[2769] Another function of VGAM97 is therefore inhibition of LOC169966 (Accession XM_093010). Accordingly, utilities of VGAM97 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC169966. LOC222234 (Accession XM_168558) is another VGAM97 host target gene. LOC222234 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC222234, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222234 BINDING SITE, designated SEQ ID:3647, to the nucleotide sequence of VGAM97 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:432.

[2770] Another function of VGAM97 is therefore inhibition of LOC222234 (Accession XM_168558). Accordingly, utilities of VGAM97 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222234. LOC254058 (Accession XM_173209) is another VGAM97 host target gene. LOC254058 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC254058, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254058 BINDING SITE, designated SEQ ID:3735, to the nucleotide sequence of VGAM97 RNA, herein designated VGAM RNA, also designated SEQ ID:432.

[2771] Another function of VGAM97 is therefore inhibition of LOC254058 (Accession XM_173209). Accordingly, utilities of VGAM97 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254058. LOC51110 (Accession NM_016027) is another VGAM97 host target gene. LOC51110 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC51110, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51110 BINDING SITE, designated SEQ ID:1657, to the nucleotide sequence of VGAM97 RNA, herein designated VGAM RNA, also designated SEQ ID:432.

[2772] Another function of VGAM97 is therefore inhibition of LOC51110 (Accession NM_016027). Accordingly, utilities of VGAM97 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51110. LOC51292 (Accession NM_016576) is another VGAM97 host target gene. LOC51292 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC51292, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51292 BINDING SITE, designated SEQ ID:1698, to the nucleotide sequence of VGAM97 RNA, herein designated VGAM RNA, also designated SEQ ID:432.

[2773] Another function of VGAM97 is therefore inhibition of LOC51292 (Accession NM_016576). Accordingly, utilities of VGAM97 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LOC51292. LOC92573 (Accession XM_045884) is another VGAM97 host target gene. LOC92573 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC92573, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92573 BINDING SITE, designated SEQ ID:2870, to the nucleotide sequence of VGAM97 RNA, herein designated VGAM RNA, also designated SEQ ID:432.

[2774] Another function of VGAM97 is therefore inhibition of LOC92573 (Accession XM_045884). Accordingly, utilities of VGAM97 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92573. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 98 (VGAM98) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[2775] VGAM98 is a novel bioinformatically detected regulatory,

non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM98 was detected is described hereinabove with reference to Figs. 1–8.

[2776] VGAM98 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus. VGAM98 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[2777] VGAM98 gene encodes a VGAM98 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM98 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM98 precursor RNA is designated SEQ ID:84, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:84 is located at position 34330 relative to the genome of Vaccinia Virus.

[2778] VGAM98 precursor RNA folds onto itself, forming VGAM98 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first

half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[2779] An enzyme complex designated DICER COMPLEX, `dices` the VGAM98 folded precursor RNA into VGAM98 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 72%) nucleotide sequence of VGAM98 RNA is designated SEQ ID:433, and is provided hereinbelow with reference to the sequence listing part.

[2780] VGAM98 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM98 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM98 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[2781] VGAM98 RNA, herein designated VGAM RNA, binds com-

plementarily to one or more host target binding sites located in untranslated regions of VGAM98 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM98 RNA is an accurate or a partial inverted-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM98 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM98 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR and 5' UTR regions.

[2782] The complementary binding of VGAM98 RNA, herein designated VGAM RNA, to host target binding sites on VGAM98 host target RNA, herein designated VGAM HOST

TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM98 host target RNA into VGAM98 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[2783] It is appreciated that VGAM98 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM98 host target genes. The mRNA of each one of this plurality of VGAM98 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM98 RNA, herein designated VGAM RNA, and which when bound by VGAM98 RNA causes inhibition of translation of respective one or more VGAM98 host target proteins.

[2784] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM98 gene, herein designated VGAM GENE, on one or more VGAM98 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific

complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[2785] It is yet further appreciated that a function of VGAM98 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM98 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM98 correlate with, and may be deduced from, the identity of the host target genes which VGAM98 binds and inhibits, and the function of these host target genes, as elaborated herein-below.

[2786] Nucleotide sequences of the VGAM98 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM98 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM98 folded precursor RNA, herein designated VGAM

FOLDED PRECURSOR RNA, of VGAM98 are further described hereinbelow with reference to Table 1.

[2787] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM98 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM98 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[2788] As mentioned hereinabove with reference to Fig. 1, a function of VGAM98 gene, herein designated VGAM is inhibition of expression of VGAM98 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM98 correlate with, and may be deduced from, the identity of the target genes which VGAM98 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[2789] Arginine Vasopressin (neurophysin II, antidiuretic hormone, diabetes insipidus, neurohypophyseal) (AVP, Accession NM_000490) is a VGAM98 host target gene. AVP BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by AVP, corresponding to a HOST TARGET binding site such as BINDING

SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AVP BINDING SITE, designated SEQ ID:752, to the nucleotide sequence of VGAM98 RNA, herein designated VGAM RNA, also designated SEQ ID:433.

[2790] A function of VGAM98 is therefore inhibition of Arginine Vasopressin (neurophysin II, antidiuretic hormone, diabetes insipidus, neurohypophyseal) (AVP, Accession NM_000490). Accordingly, utilities of VGAM98 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AVP. HTRA3 (Accession XM_114416) is another VGAM98 host target gene. HTRA3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HTRA3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HTRA3 BINDING SITE, designated SEQ ID:3457, to the nucleotide sequence of VGAM98 RNA, herein designated VGAM RNA, also designated SEQ ID:433.

[2791] Another function of VGAM98 is therefore inhibition of HTRA3 (Accession XM_114416). Accordingly, utilities of VGAM98 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with HTRA3. Lectin, Galactoside-binding, Soluble, 3 Binding Protein (LGALS3BP, Accession XM_045104) is another VGAM98 host target gene. LGALS3BP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LGALS3BP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LGALS3BP BINDING SITE, designated SEQ ID:2851, to the nucleotide sequence of VGAM98 RNA, herein designated VGAM RNA, also designated SEQ ID:433.

[2792] Another function of VGAM98 is therefore inhibition of Lectin, Galactoside-binding, Soluble, 3 Binding Protein (LGALS3BP, Accession XM_045104). Accordingly, utilities of VGAM98 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LGALS3BP. MAD2 Mitotic Arrest Deficient-like 1 (yeast) (MAD2L1, Accession NM_002358) is another VGAM98 host target gene. MAD2L1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MAD2L1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or

BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAD2L1 BINDING SITE, designated SEQ ID:921, to the nucleotide sequence of VGAM98 RNA, herein designated VGAM RNA, also designated SEQ ID:433.

[2793] Another function of VGAM98 is therefore inhibition of MAD2 Mitotic Arrest Deficient-like 1 (yeast) (MAD2L1, Accession NM_002358), a gene which may monitor the completeness of the spindle-kinetochore attachment. delays the onset of anaphase when this process is not complete. Accordingly, utilities of VGAM98 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAD2L1. The function of MAD2L1 has been established by previous studies. Using a yeast 2-hybrid analysis with the cytoplasmic tails of several a disintegrin and metalloproteinase domain (ADAM) proteins as bait, Nelson et al. (1999) found that MAD2L1 interacts strongly with TACE (ADAM17; 603639) but not with ADAM9 (OMIM Ref. No. 602713), which interacts with MAD2L2, or with other ADAMs tested. Further binding analyses defined a 35-amino acid stretch of TACE containing a proline-rich SH3-ligand domain (OMIM Ref. No. PXPXXP) as the interaction site for MAD2L1. Luo et al.

(2002) showed that RNA interference-mediated suppression of MAD1 (OMIM Ref. No. 602686) function in mammalian cells caused loss of MAD2 kinetochore localization and impairment of the spindle checkpoint. MAD1 and CDC20 (OMIM Ref. No. 603618) contain MAD2-binding motifs that share a common consensus, and the authors identified a class of MAD2-binding peptides (MBPs) with a similar consensus. Binding of one of these ligands, MBP1, triggered an extensive rearrangement of the tertiary structure of MAD2. MAD2 also underwent a similar striking structural change upon binding to a MAD1 or CDC20 binding motif peptide. These data suggested that, upon checkpoint activation, MAD1 recruits MAD2 to unattached kinetochores and may promote binding of MAD2 to CDC20. Animal model experiments lend further support to the function of MAD2L1. The initiation of chromosome segregation at anaphase is linked by the spindle assembly checkpoint to the completion of chromosome-microtubule attachment during metaphase. To determine the function of the Mad2 protein during normal cell division, Dobles et al. (2000) knocked out the Mad2 gene in mice. They found that embryonic cells lacking Mad2 at embryonic day 5.5, like mad2 yeast, grew normally but were un-

able to arrest in response to spindle disruption. At embryonic day 6.5, the cells of the epiblast began rapid cell division, and the absence of a checkpoint resulted in widespread chromosome missegregation and apoptosis. In contrast, the postmitotic trophoblast giant cells survived without Mad2. Thus, the spindle assembly checkpoint is required for accurate chromosome segregation in mitotic mouse cells and for embryonic viability, even in the absence of spindle damage. Shonn et al. (2000) characterized the spindle checkpoint in meiosis of *S. cerevisiae* by comparing wildtype and *mad2*-deficient yeast. In the absence of the checkpoint, the frequency of meiosis I missegregation increased with increasing chromosome length, reaching 19% for the longest chromosome. Meiosis I nondisjunction in spindle checkpoint mutants could be prevented by delaying the onset of anaphase. In a recombinant-defective mutant, the checkpoint delayed the biochemical events of anaphase I, suggesting that chromosomes that are attached to microtubules but are not under tension can activate the spindle checkpoint. Spindle checkpoint mutants reduced the accuracy of chromosome segregation in meiosis I much more than that in meiosis II, suggesting that checkpoint defects may contribute to

Down syndrome (OMIM Ref. No. 190685). Shonn et al. (2000) showed that the budding yeast spindle checkpoint, which is largely dispensable in wildtype mitosis, plays a critical role in meiotic chromosome segregation. They suggested that the difference may reflect the different chromosome linkages in mitosis and meiosis I. In mitosis, sister chromatid cohesion forces sister kinetochores to face opposite spindle poles. In meiosis I, homologs are linked at sites of recombination that can be far from the kinetochores, creating a floppy linkage. If the nearest recombination event is further from the centromere on long chromosomes, this idea may explain why long chromosomes preferentially nondisjoin in checkpoint-defective cells. Michel et al. (2001) reported that deletion of one MAD2 allele results in a defective mitotic checkpoint in both human cancer cells and murine primary embryonic fibroblasts. Checkpoint-defective cells show premature sister chromatid separation in the presence of spindle inhibitors and an elevated rate of chromosome missegregation events in the absence of these agents. Furthermore, Mad2 +/– mice develop lung tumors at high rates after long latencies, implicating defects in the mitotic checkpoint in tumorigenesis

[2794] It is appreciated that the abovementioned animal model for MAD2L1 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[2795] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[2796] Michel, L. S.; Liberal, V.; Chatterjee, A.; Kirchwegger, R.; Pasche, B.; Gerald, W.; Dobles, M.; Sorger, P. K.; Murty, V. V. S.; Benezra, R. : MAD2 haplo-insufficiency causes premature anaphase and chromosome instability in mammalian cells. Nature 409: 355–359, 2001. ; and

[2797] Luo, X.; Tang, Z.; Rizo, J.; Yu, H. : The Mad2 spindle checkpoint protein undergoes similar major conformational changes upon binding to either Mad1 or Cdc20. Molec. Cell 9: 59–71, 2002.

[2798] Further studies establishing the function and utilities of MAD2L1 are found in John Hopkins OMIM database record ID 601467, and in sited publications numbered 631–641 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Phosphorylase, Glycogen; Muscle (McArdle syndrome, glycogen storage disease type V) (PYGM, Accession NM_005609) is another

VGAM98 host target gene. PYGM BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by PYGM, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PYGM BINDING SITE, designated SEQ ID:1230, to the nucleotide sequence of VGAM98 RNA, herein designated VGAM RNA, also designated SEQ ID:433.

[2799] Another function of VGAM98 is therefore inhibition of Phosphorylase, Glycogen; Muscle (McArdle syndrome, glycogen storage disease type V) (PYGM, Accession NM_005609). Accordingly, utilities of VGAM98 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PYGM. Solute Carrier Family 35 (UDP-N-acetylglucosamine (UDP-GlcNAc) Transporter), Member 3 (SLC35A3, Accession NM_012243) is another VGAM98 host target gene. SLC35A3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SLC35A3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC35A3 BINDING

SITE, designated SEQ ID:1418, to the nucleotide sequence of VGAM98 RNA, herein designated VGAM RNA, also designated SEQ ID:433.

[2800] Another function of VGAM98 is therefore inhibition of Solute Carrier Family 35 (UDP-N-acetylglucosamine (UDP-GlcNAc) Transporter), Member 3 (SLC35A3, Accession NM_012243). Accordingly, utilities of VGAM98 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC35A3. ATP Synthase Mitochondrial F1 Complex Assembly Factor 1 (ATPAF1, Accession XM_027313) is another VGAM98 host target gene. ATPAF1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ATPAF1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATPAF1 BINDING SITE, designated SEQ ID:2583, to the nucleotide sequence of VGAM98 RNA, herein designated VGAM RNA, also designated SEQ ID:433.

[2801] Another function of VGAM98 is therefore inhibition of ATP Synthase Mitochondrial F1 Complex Assembly Factor 1 (ATPAF1, Accession XM_027313). Accordingly, utilities of

VGAM98 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATPAF1. Chromosome 7 Open Reading Frame 13 (C7orf13, Accession NM_032625) is another VGAM98 host target gene. C7orf13 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C7orf13, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C7orf13 BINDING SITE, designated SEQ ID:2265, to the nucleotide sequence of VGAM98 RNA, herein designated VGAM RNA, also designated SEQ ID:433.

[2802] Another function of VGAM98 is therefore inhibition of Chromosome 7 Open Reading Frame 13 (C7orf13, Accession NM_032625). Accordingly, utilities of VGAM98 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C7orf13. Cas-Br-M (murine) Ecotropic Retroviral Transforming Sequence C (CBLC, Accession NM_012116) is another VGAM98 host target gene. CBLC BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CBLC, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CBLC BINDING SITE, designated SEQ ID:1407, to the nucleotide sequence of VGAM98 RNA, herein designated VGAM RNA, also designated SEQ ID:433.

[2803] Another function of VGAM98 is therefore inhibition of Cas-Br-M (murine) Ecotropic Retroviral Transforming Sequence C (CBLC, Accession NM_012116). Accordingly, utilities of VGAM98 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CBLC. FLJ10241 (Accession NM_018035) is another VGAM98 host target gene. FLJ10241 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10241, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10241 BINDING SITE, designated SEQ ID:1776, to the nucleotide sequence of VGAM98 RNA, herein designated VGAM RNA, also designated SEQ ID:433.

[2804] Another function of VGAM98 is therefore inhibition of FLJ10241 (Accession NM_018035). Accordingly, utilities of

VGAM98 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10241. FLJ20651 (Accession NM_017919) is another VGAM98 host target gene. FLJ20651 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ20651, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20651 BINDING SITE, designated SEQ ID:1761, to the nucleotide sequence of VGAM98 RNA, herein designated VGAM RNA, also designated SEQ ID:433.

[2805] Another function of VGAM98 is therefore inhibition of FLJ20651 (Accession NM_017919). Accordingly, utilities of VGAM98 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20651. KIAA1203 (Accession XM_049683) is another VGAM98 host target gene. KIAA1203 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1203, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1203 BINDING SITE,

designated SEQ ID:2922, to the nucleotide sequence of VGAM98 RNA, herein designated VGAM RNA, also designated SEQ ID:433.

[2806] Another function of VGAM98 is therefore inhibition of KIAA1203 (Accession XM_049683). Accordingly, utilities of VGAM98 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1203. PL6 (Accession NM_007024) is another VGAM98 host target gene. PL6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PL6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PL6 BINDING SITE, designated SEQ ID:1348, to the nucleotide sequence of VGAM98 RNA, herein designated VGAM RNA, also designated SEQ ID:433.

[2807] Another function of VGAM98 is therefore inhibition of PL6 (Accession NM_007024). Accordingly, utilities of VGAM98 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PL6. Scavenger Receptor Cysteine Rich Domain Containing, Group B (4 domains) (SRCRB4D, Accession NM_080744) is another

VGAM98 host target gene. SRCRB4D BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SRCRB4D, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SRCRB4D BINDING SITE, designated SEQ ID:2386, to the nucleotide sequence of VGAM98 RNA, herein designated VGAM RNA, also designated SEQ ID:433.

[2808] Another function of VGAM98 is therefore inhibition of Scavenger Receptor Cysteine Rich Domain Containing, Group B (4 domains) (SRCRB4D, Accession NM_080744). Accordingly, utilities of VGAM98 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SRCRB4D. Synaptopodin 2 (SYNPO2, Accession XM_050219) is another VGAM98 host target gene. SYNPO2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SYNPO2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SYNPO2 BINDING SITE, designated SEQ ID:2928, to the nucleotide sequence of VGAM98 RNA,

herein designated VGAM RNA, also designated SEQ ID:433.

[2809] Another function of VGAM98 is therefore inhibition of Synaptopodin 2 (SYNPO2, Accession XM_050219). Accordingly, utilities of VGAM98 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SYNPO2. LOC145858 (Accession XM_085258) is another VGAM98 host target gene. LOC145858 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC145858, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145858 BINDING SITE, designated SEQ ID:3085, to the nucleotide sequence of VGAM98 RNA, herein designated VGAM RNA, also designated SEQ ID:433.

[2810] Another function of VGAM98 is therefore inhibition of LOC145858 (Accession XM_085258). Accordingly, utilities of VGAM98 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145858. LOC151162 (Accession XM_098012) is another VGAM98 host target gene. LOC151162 BINDING SITE is HOST TARGET binding site found in the 5' un-

translated region of mRNA encoded by LOC151162, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151162 BINDING SITE, designated SEQ ID:3338, to the nucleotide sequence of VGAM98 RNA, herein designated VGAM RNA, also designated SEQ ID:433.

[2811] Another function of VGAM98 is therefore inhibition of LOC151162 (Accession XM_098012). Accordingly, utilities of VGAM98 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151162. LOC196410 (Accession XM_113713) is another VGAM98 host target gene. LOC196410 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC196410, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC196410 BINDING SITE, designated SEQ ID:3411, to the nucleotide sequence of VGAM98 RNA, herein designated VGAM RNA, also designated SEQ ID:433.

[2812] Another function of VGAM98 is therefore inhibition of LOC196410 (Accession XM_113713). Accordingly, utilities

of VGAM98 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196410. LOC203339 (Accession XM_117534) is another VGAM98 host target gene. LOC203339 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC203339, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC203339 BINDING SITE, designated SEQ ID:3489, to the nucleotide sequence of VGAM98 RNA, herein designated VGAM RNA, also designated SEQ ID:433.

[2813] Another function of VGAM98 is therefore inhibition of LOC203339 (Accession XM_117534). Accordingly, utilities of VGAM98 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC203339. LOC203377 (Accession XM_117540) is another VGAM98 host target gene. LOC203377 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC203377, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC203377 BINDING SITE, designated SEQ ID:3490, to the nucleotide sequence of VGAM98 RNA, herein designated VGAM RNA, also designated SEQ ID:433.

[2814] Another function of VGAM98 is therefore inhibition of LOC203377 (Accession XM_117540). Accordingly, utilities of VGAM98 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC203377. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 99 (VGAM99) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[2815] VGAM99 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM99 was detected is described hereinabove with reference to Figs. 1–8.

[2816] VGAM99 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus. VGAM99 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[2817] VGAM99 gene encodes a VGAM99 precursor RNA, herein

designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM99 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM99 precursor RNA is designated SEQ ID:85, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:85 is located at position 39758 relative to the genome of Vaccinia Virus.

[2818] VGAM99 precursor RNA folds onto itself, forming VGAM99 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[2819] An enzyme complex designated DICER COMPLEX, `dices` the VGAM99 folded precursor RNA into VGAM99 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 73%) nucleotide sequence of VGAM99 RNA is designated SEQ ID:434, and is provided hereinbelow with reference to the sequence listing part.

[2820] VGAM99 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM99 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM99 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[2821] VGAM99 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM99 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM99 RNA is an accurate or a partial inverted-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, desig-

nated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM99 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM99 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[2822] The complementary binding of VGAM99 RNA, herein designated VGAM RNA, to host target binding sites on VGAM99 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM99 host target RNA into VGAM99 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[2823] It is appreciated that VGAM99 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM99 host target genes. The mRNA of

each one of this plurality of VGAM99 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM99 RNA, herein designated VGAM RNA, and which when bound by VGAM99 RNA causes inhibition of translation of respective one or more VGAM99 host target proteins.

[2824] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM99 gene, herein designated VGAM GENE, on one or more VGAM99 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[2825] It is yet further appreciated that a function of VGAM99 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM99 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM99 correlate with, and may be deduced from, the identity of the host target genes which VGAM99 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[2826] Nucleotide sequences of the VGAM99 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM99 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM99 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM99 are further described hereinbelow with reference to Table 1.

[2827] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM99 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM99 RNA, herein designated VGAM RNA, are described hereinbelow with refer-

ence to Table 2.

[2828] As mentioned hereinabove with reference to Fig. 1, a function of VGAM99 gene, herein designated VGAM is inhibition of expression of VGAM99 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM99 correlate with, and may be deduced from, the identity of the target genes which VGAM99 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[2829] Sel-1 Suppressor of Lin-12-like (C. elegans) (SEL1L, Accession NM_005065) is a VGAM99 host target gene. SEL1L BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SEL1L, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SEL1L BINDING SITE, designated SEQ ID:1179, to the nucleotide sequence of VGAM99 RNA, herein designated VGAM RNA, also designated SEQ ID:434.

[2830] A function of VGAM99 is therefore inhibition of Sel-1 Suppressor of Lin-12-like (C. elegans) (SEL1L, Accession NM_005065), a gene which may play a role in notch signaling (by similarity). Accordingly, utilities of VGAM99 in-

clude diagnosis, prevention and treatment of diseases and clinical conditions associated with SEL1L. The function of SEL1L has been established by previous studies. Biunno et al. (1997) isolated a novel cDNA, designated SEL1L by them, that shows sequence similarities to sel-1, a gene identified as an extragenic suppressor of the lin-12 hypomorphic mutant from *C. elegans* (3,4:Grant and Greenwald, 1996, 1997). SEL1L exhibited a tissue-specific pattern of expression: high levels of a single 7.5-kb transcript were detected only in the pancreas of healthy individuals, whereas low to undetectable levels were observed in other adult tissues and in some fetal tissues. Because of the tissue-specific expression of the gene, Biunno et al. (1997) studied the gene in human pancreatic carcinomas. They found that 17% of adenocarcinomas of the pancreas did not express SEL1L to a detectable level; however, no gross genomic alterations were apparent within a few hundred kb of the relevant region. By somatic cell hybrid analysis and fluorescence in situ hybridization, Biunno et al. (1997) mapped the SEL1L gene to chromosome 14q31. Donoviel and Bernstein (1999) localized the gene to 14q24.3-q31 by FISH and radiation hybrid analysis.

[2831] Full details of the abovementioned studies are described

in the following publications, the disclosure of which are hereby incorporated by reference:

- [2832] Biunno, I.; Appierto, V.; Cattaneo, M.; Leone, B. E.; Balzano, G.; Socci, C.; Saccone, S.; Letizia, A.; Valle, G. D.; Sgaramella, V. : Isolation of a pancreas-specific gene located on human chromosome 14q31: expression analysis in human pancreatic ductal carcinomas. *Genomics* 46: 284–286, 1997. ; and
- [2833] Donoviel, D. B.; Bernstein, A. : SEL-1L maps to human chromosome 14, near the insulin-dependent diabetes mellitus locus 11. *Genomics* 56: 232–233, 1999.
- [2834] Further studies establishing the function and utilities of SEL1L are found in John Hopkins OMIM database record ID 602329, and in cited publications numbered 1400–1403 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. DKFZP564O1863 (Accession XM_043922) is another VGAM99 host target gene. DKFZP564O1863 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP564O1863, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP564O1863

BINDING SITE, designated SEQ ID:2826, to the nucleotide sequence of VGAM99 RNA, herein designated VGAM RNA, also designated SEQ ID:434.

[2835] Another function of VGAM99 is therefore inhibition of DKFZP564O1863 (Accession XM_043922). Accordingly, utilities of VGAM99 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP564O1863. LOC129446 (Accession XM_072203) is another VGAM99 host target gene. LOC129446 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC129446, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC129446 BINDING SITE, designated SEQ ID:3042, to the nucleotide sequence of VGAM99 RNA, herein designated VGAM RNA, also designated SEQ ID:434.

[2836] Another function of VGAM99 is therefore inhibition of LOC129446 (Accession XM_072203). Accordingly, utilities of VGAM99 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC129446. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the

present invention, referred to here as Viral Genomic Address Messenger 100 (VGAM100) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[2837] VGAM100 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM100 was detected is described hereinabove with reference to Figs. 1–8.

[2838] VGAM100 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM100 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[2839] VGAM100 gene encodes a VGAM100 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM100 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM100 precursor RNA is designated SEQ ID:86, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:86 is located at position 36878 relative to the genome of Vac–

cinia Virus.

[2840] VGAM100 precursor RNA folds onto itself, forming VGAM100 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[2841] An enzyme complex designated DICER COMPLEX, `dices` the VGAM100 folded precursor RNA into VGAM100 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of VGAM100 RNA is designated SEQ ID:435, and is provided hereinbelow with reference to the sequence listing part.

[2842] VGAM100 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM100 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM100 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[2843] VGAM100 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM100 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM100 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM100 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM100 host target RNA, herein designated VGAM HOST TARGET RNA. It is further

appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[2844] The complementary binding of VGAM100 RNA, herein designated VGAM RNA, to host target binding sites on VGAM100 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM100 host target RNA into VGAM100 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[2845] It is appreciated that VGAM100 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM100 host target genes. The mRNA of each one of this plurality of VGAM100 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM100 RNA, herein designated VGAM RNA, and which when bound by VGAM100 RNA causes inhibition of translation of respective one or more VGAM100 host target proteins.

[2846] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM100 gene, herein designated VGAM GENE, on one or more VGAM100 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[2847] It is yet further appreciated that a function of VGAM100 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM100 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM100 correlate

with, and may be deduced from, the identity of the host target genes which VGAM100 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[2848] Nucleotide sequences of the VGAM100 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM100 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM100 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM100 are further described hereinbelow with reference to Table 1.

[2849] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM100 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM100 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[2850] As mentioned hereinabove with reference to Fig. 1, a function of VGAM100 gene, herein designated VGAM is inhibition of expression of VGAM100 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM100 correlate with, and may be deduced

from, the identity of the target genes which VGAM100 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[2851] Cytochrome P450, Subfamily XIX (aromatization of androgens) (CYP19, Accession NM_000103) is a VGAM100 host target gene. CYP19 BINDING SITE1 and CYP19 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by CYP19, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CYP19 BINDING SITE1 and CYP19 BINDING SITE2, designated SEQ ID:705 and SEQ ID:2185 respectively, to the nucleotide sequence of VGAM100 RNA, herein designated VGAM RNA, also designated SEQ ID:435.

[2852] A function of VGAM100 is therefore inhibition of Cytochrome P450, Subfamily XIX (aromatization of androgens) (CYP19, Accession NM_000103), a gene which catalyzes the last steps of estrogen biosynthesis. Accordingly, utilities of VGAM100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CYP19. The function of CYP19 has been established by previous studies. The distinct gender-specific

patterns of fat distribution in men and women (android and gynoid) suggest a role for sex steroids. It has been suggested that estrogens can promote preadipocyte cell proliferation and/or differentiation. The enzyme CYP19 is responsible for the conversion of androgen precursor steroids to estrogens and may, therefore, have a role in regulating adipose tissue mass and its distribution. McTernan et al. (2002) investigated the glucocorticoid regulation of aromatase expression in adipose tissue, specifically to define any site- and gender-specific differences. Abdominal subcutaneous and omental adipose tissue was obtained from male and female patients undergoing elective surgery. Cortisol-induced aromatase activity in omental adipocytes from postmenopausal females was higher than that in premenopausal females (P less than 0.001). Insulin had no independent effect on aromatase expression, but coincubation of preadipocytes with cortisol and insulin eliminated both gender- and site-specific differences. The authors concluded that in women, but not men, cortisol increases aromatase activity at subcutaneous sites, and this may facilitate predilection for subcutaneous adiposity in females. They suggested that the observed site-, gender-, and menopausal-specific differ-

ences in the glucocorticoid regulation of this enzyme may contribute to the gender- and menopausal-specific patterns of fat distribution. Hemsell et al. (1977) reported a case of gynecomastia apparently due to excessive peripheral conversion of androgen to estrogen as a result of 50-times-normal aromatase activity. The patient was an adopted boy, aged 11 years 7 months. Effects of excessive estrogen became evident at age 8, the time when plasma androstenedione begins to increase. Extraglandular aromatization, as well as sulfurylation, is extensively involved in C19-steroid metabolism in the fetus, but the activity of the enzymes falls rapidly after birth. In the patient of Hemsell et al. (1977), the fetal situation appeared to persist. Berkovitz et al. (1985) investigated a black family in which marked gynecomastia with normal male genitalia occurred in 5 men in 3 sibships of 2 generations connected through females. In each, gynecomastia and male sexual differentiation began at an early age (10 to 11 years). The ratio of the concentration of plasma estradiol-17 beta to that of plasma testosterone was elevated in each. In 3 affected sibs, the transfer constant of conversion of androstenedione to estrone (i.e., the fraction of plasma androstenedione that was converted to estrone as

measured in the urine) was 10 times the normal. Despite elevated extraglandular aromatase activity, the hypothalamic-pituitary axis responded normally to provocative stimuli. None of the 5 males had children, but 4 were still in their teens; the fifth was 29 years of age. The pattern of inheritance of familial gynecomastia with increased aromatase activity is consistent with either X-linked recessive or autosomal dominant, male-limited inheritance. Mapping of the aromatase locus to an autosome makes the latter possibility highly likely. Autosomal dominant inheritance appeared likely in a family, reported by Leiberman and Zachmann (1992), in which increased steroid aromatization seemed to be responsible for 'familial adrenal feminization.' The father and 2 male and 2 female sibs had gynecomastia, early growth, and short final stature. The 8-year-old propositus had advanced bone age, facial acne, gynecomastia, pubic hair, and prepubertal testicular volume. ACTH-dependent adrenal feminization was confirmed by a transient reduction of breast tissue following dexamethasone or cyproterone acetate treatment. Testolactone, which is an inhibitor of peripheral aromatase activity in vivo, temporarily reduced the breast tissue. This was the first example of male-to-male and

male-to-female transmission reported. Animal model experiments lend further support to the function of CYP19. Aromatase knockout (ArKO) mice, lacking a functional Cyp19 gene, cannot synthesize endogenous estrogens. Jones et al. (2000) examined the adipose deposits of male and female ArKO mice, observing that these animal progressively accumulated significantly more intraabdominal adipose tissue than their wildtype littermates, reflected in increased adipocyte volume at gonadal and infrarenal sites. This increased adiposity was not due to hyperphagia or reduced resting energy expenditure, but was associated with reduced spontaneous physical activity levels, reduced glucose oxidation, and a decrease in lean body mass. A striking accumulation of lipid droplets was observed in the livers of ArKO animals. The findings demonstrated an important role for estrogen in the maintenance of lipid homeostasis in both males and females. Along the same lines, Heine et al. (2000) studied male and female Esr1 knockout mice and found that signaling by this receptor is critical in female and male white adipose tissue. Obesity in the males involved a mechanism of reduced energy expenditure rather than increased energy intake.

[2853] It is appreciated that the abovementioned animal model

for CYP19 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[2854] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[2855] Deladoey, J.; Fluck, C.; Bex, M.; Yoshimura, N.; Harada, N.; Mullis, P. E. : Aromatase deficiency caused by a novel P450(arom) gene mutation: impact of absent estrogen production on serum gonadotropin concentration in a boy. J. Clin. Endocr. Metab. 84: 4050–4054, 1999. ; and

[2856] Yang, S.; Fang, Z.; Suzuki, T.; Sasano, H.; Zhou, J.; Gurrates, B.; Tamura, M.; Ferrer, K.; Bulun, S. : Regulation of aromatase P450 expression in endometriotic and endometrial stromal.

[2857] Further studies establishing the function and utilities of CYP19 are found in John Hopkins OMIM database record ID 107910, and in cited publications numbered 1052, 1076–1091, 497, 1092–1093, 201, 1094–1103, 5, 3020–3021, 69 and 3022–3026 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Macrophage Scavenger Receptor 1 (MSR1, Accession NM_138715) is another VGAM100 host target

gene. MSR1 BINDING SITE1 and MSR1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by MSR1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MSR1 BINDING SITE1 and MSR1 BINDING SITE2, designated SEQ ID:2453 and SEQ ID:2454 respectively, to the nucleotide sequence of VGAM100 RNA, herein designated VGAM RNA, also designated SEQ ID:435.

[2858] Another function of VGAM100 is therefore inhibition of Macrophage Scavenger Receptor 1 (MSR1, Accession NM_138715), a gene which plays a role in endocytosis of macromolecules. Accordingly, utilities of VGAM100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MSR1. The function of MSR1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM49. Glutaminyl-peptide Cyclotransferase (glutaminyl cyclase) (QPCT, Accession NM_012413) is another VGAM100 host target gene. QPCT BINDING SITE is HOST TARGET binding site found in the 3' untranslated region

of mRNA encoded by QPCT, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of QPCT BINDING SITE, designated SEQ ID:1428, to the nucleotide sequence of VGAM100 RNA, herein designated VGAM RNA, also designated SEQ ID:435.

[2859] Another function of VGAM100 is therefore inhibition of Glutaminyl-peptide Cyclotransferase (glutaminyl cyclase) (QPCT, Accession NM_012413). Accordingly, utilities of VGAM100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with QPCT. Twist Homolog (acrocephalosyndactyly 3; Saethre-Chotzen syndrome) (*Drosophila*) (TWIST, Accession NM_000474) is another VGAM100 host target gene. TWIST BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TWIST, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TWIST BINDING SITE, designated SEQ ID:750, to the nucleotide sequence of VGAM100 RNA, herein designated VGAM RNA, also designated SEQ ID:435.

[2860] Another function of VGAM100 is therefore inhibition of Twist Homolog (acrocephalosyndactyly 3; Saethre-Chotzen syndrome) (Drosophila) (TWIST, Accession NM_000474). Accordingly, utilities of VGAM100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TWIST. ATPase, Class II, Type 9A (ATP9A, Accession XM_030577) is another VGAM100 host target gene. ATP9A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ATP9A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATP9A BINDING SITE, designated SEQ ID:2617, to the nucleotide sequence of VGAM100 RNA, herein designated VGAM RNA, also designated SEQ ID:435.

[2861] Another function of VGAM100 is therefore inhibition of ATPase, Class II, Type 9A (ATP9A, Accession XM_030577). Accordingly, utilities of VGAM100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP9A. Calneuron 1 (CALN1, Accession NM_031468) is another VGAM100 host target gene. CALN1 BINDING SITE is HOST TARGET binding site found

in the 3` untranslated region of mRNA encoded by CALN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CALN1 BINDING SITE, designated SEQ ID:2207, to the nucleotide sequence of VGAM100 RNA, herein designated VGAM RNA, also designated SEQ ID:435.

[2862] Another function of VGAM100 is therefore inhibition of Calneuron 1 (CALN1, Accession NM_031468). Accordingly, utilities of VGAM100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CALN1. FLJ23277 (Accession NM_032236) is another VGAM100 host target gene. FLJ23277 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ23277, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23277 BINDING SITE, designated SEQ ID:2238, to the nucleotide sequence of VGAM100 RNA, herein designated VGAM RNA, also designated SEQ ID:435.

[2863] Another function of VGAM100 is therefore inhibition of

FLJ23277 (Accession NM_032236). Accordingly, utilities of VGAM100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23277. KIAA0992 (Accession NM_016081) is another VGAM100 host target gene. KIAA0992 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0992, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0992 BINDING SITE, designated SEQ ID:1661, to the nucleotide sequence of VGAM100 RNA, herein designated VGAM RNA, also designated SEQ ID:435.

[2864] Another function of VGAM100 is therefore inhibition of KIAA0992 (Accession NM_016081). Accordingly, utilities of VGAM100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0992. KIAA1045 (Accession XM_048592) is another VGAM100 host target gene. KIAA1045 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1045, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of KIAA1045 BINDING SITE, designated SEQ ID:2906, to the nucleotide sequence of VGAM100 RNA, herein designated VGAM RNA, also designated SEQ ID:435.

[2865] Another function of VGAM100 is therefore inhibition of KIAA1045 (Accession XM_048592). Accordingly, utilities of VGAM100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1045. KIAA1056 (Accession NM_014894) is another VGAM100 host target gene. KIAA1056 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1056, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1056 BINDING SITE, designated SEQ ID:1575, to the nucleotide sequence of VGAM100 RNA, herein designated VGAM RNA, also designated SEQ ID:435.

[2866] Another function of VGAM100 is therefore inhibition of KIAA1056 (Accession NM_014894). Accordingly, utilities of VGAM100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1056. KIAA1323 (Accession XM_032146) is another

VGAM100 host target gene. KIAA1323 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1323, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1323 BINDING SITE, designated SEQ ID:2646, to the nucleotide sequence of VGAM100 RNA, herein designated VGAM RNA, also designated SEQ ID:435.

[2867] Another function of VGAM100 is therefore inhibition of KIAA1323 (Accession XM_032146). Accordingly, utilities of VGAM100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1323. Leiomodin 1 (smooth muscle) (LMOD1, Accession NM_012134) is another VGAM100 host target gene. LMOD1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LMOD1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LMOD1 BINDING SITE, designated SEQ ID:1409, to the nucleotide sequence of VGAM100 RNA, herein designated VGAM RNA, also designated SEQ

ID:435.

[2868] Another function of VGAM100 is therefore inhibition of Leiomodin 1 (smooth muscle) (LMOD1, Accession NM_012134). Accordingly, utilities of VGAM100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LMOD1. Ring Finger Protein 32 (RNF32, Accession NM_030936) is another VGAM100 host target gene. RNF32 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RNF32, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RNF32 BINDING SITE, designated SEQ ID:2172, to the nucleotide sequence of VGAM100 RNA, herein designated VGAM RNA, also designated SEQ ID:435.

[2869] Another function of VGAM100 is therefore inhibition of Ring Finger Protein 32 (RNF32, Accession NM_030936). Accordingly, utilities of VGAM100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RNF32. SS-56 (Accession XM_006063) is another VGAM100 host target gene. SS-56 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by SS-56, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SS-56 BINDING SITE, designated SEQ ID:2535, to the nucleotide sequence of VGAM100 RNA, herein designated VGAM RNA, also designated SEQ ID:435.

[2870] Another function of VGAM100 is therefore inhibition of SS-56 (Accession XM_006063). Accordingly, utilities of VGAM100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SS-56. LOC122792 (Accession NM_145251) is another VGAM100 host target gene. LOC122792 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC122792, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC122792 BINDING SITE, designated SEQ ID:2518, to the nucleotide sequence of VGAM100 RNA, herein designated VGAM RNA, also designated SEQ ID:435.

[2871] Another function of VGAM100 is therefore inhibition of LOC122792 (Accession NM_145251). Accordingly, utilities

of VGAM100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC122792. LOC146512 (Accession XM_085490) is another VGAM100 host target gene. LOC146512 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC146512, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146512 BINDING SITE, designated SEQ ID:3094, to the nucleotide sequence of VGAM100 RNA, herein designated VGAM RNA, also designated SEQ ID:435.

[2872] Another function of VGAM100 is therefore inhibition of LOC146512 (Accession XM_085490). Accordingly, utilities of VGAM100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146512. LOC201633 (Accession XM_117317) is another VGAM100 host target gene. LOC201633 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC201633, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC201633 BINDING SITE, designated SEQ ID:3483, to the nucleotide sequence of VGAM100 RNA, herein designated VGAM RNA, also designated SEQ ID:435.

[2873] Another function of VGAM100 is therefore inhibition of LOC201633 (Accession XM_117317). Accordingly, utilities of VGAM100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201633. LOC202126 (Accession XM_117362) is another VGAM100 host target gene. LOC202126 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC202126, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC202126 BINDING SITE, designated SEQ ID:3486, to the nucleotide sequence of VGAM100 RNA, herein designated VGAM RNA, also designated SEQ ID:435.

[2874] Another function of VGAM100 is therefore inhibition of LOC202126 (Accession XM_117362). Accordingly, utilities of VGAM100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC202126. LOC221755 (Accession XM_166465) is another VGAM100 host target gene. LOC221755 BINDING

SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221755, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221755 BINDING SITE, designated SEQ ID:3563, to the nucleotide sequence of VGAM100 RNA, herein designated VGAM RNA, also designated SEQ ID:435.

[2875] Another function of VGAM100 is therefore inhibition of LOC221755 (Accession XM_166465). Accordingly, utilities of VGAM100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221755. LOC257334 (Accession XM_173202) is another VGAM100 host target gene. LOC257334 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC257334, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257334 BINDING SITE, designated SEQ ID:3734, to the nucleotide sequence of VGAM100 RNA, herein designated VGAM RNA, also designated SEQ ID:435.

[2876] Another function of VGAM100 is therefore inhibition of

LOC257334 (Accession XM_173202). Accordingly, utilities of VGAM100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257334. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 101 (VGAM101) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[2877] VGAM101 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM101 was detected is described hereinabove with reference to Figs. 1–8.

[2878] VGAM101 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM101 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[2879] VGAM101 gene encodes a VGAM101 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM101 precursor RNA does not encode a protein. A nucleotide

sequence identical or highly similar to the nucleotide sequence of VGAM101 precursor RNA is designated SEQ ID:87, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:87 is located at position 41548 relative to the genome of Vaccinia Virus.

[2880] VGAM101 precursor RNA folds onto itself, forming VGAM101 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[2881] An enzyme complex designated DICER COMPLEX, `dices` the VGAM101 folded precursor RNA into VGAM101 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide se-

quence of VGAM101 RNA is designated SEQ ID:436, and is provided hereinbelow with reference to the sequence listing part.

[2882] VGAM101 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM101 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM101 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[2883] VGAM101 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM101 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM101 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is

meant as an illustration only, and is not meant to be limiting – VGAM101 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM101 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[2884] The complementary binding of VGAM101 RNA, herein designated VGAM RNA, to host target binding sites on VGAM101 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM101 host target RNA into VGAM101 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[2885] It is appreciated that VGAM101 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM101 host target genes. The mRNA of each one of this plurality of VGAM101 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM101 RNA, herein designated VGAM RNA, and which when bound by VGAM101 RNA causes inhibition of translation of respective one or more VGAM101 host target proteins.

[2886] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM101 gene, herein designated VGAM GENE, on one or more VGAM101 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[2887] It is yet further appreciated that a function of VGAM101 is

inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM101 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM101 correlate with, and may be deduced from, the identity of the host target genes which VGAM101 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[2888] Nucleotide sequences of the VGAM101 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM101 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM101 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM101 are further described hereinbelow with reference to Table 1.

[2889] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM101 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM101 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[2890] As mentioned hereinabove with reference to Fig. 1, a function of VGAM101 gene, herein designated VGAM is inhibition of expression of VGAM101 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM101 correlate with, and may be deduced from, the identity of the target genes which VGAM101 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[2891] Angiopoietin 1 (ANGPT1, Accession NM_001146) is a VGAM101 host target gene. ANGPT1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ANGPT1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ANGPT1 BINDING SITE, designated SEQ ID:804, to the nucleotide sequence of VGAM101 RNA, herein designated VGAM RNA, also designated SEQ ID:436.

[2892] A function of VGAM101 is therefore inhibition of Angiopoietin 1 (ANGPT1, Accession NM_001146), a gene which binds and activates tie2 receptor by inducing its tyrosine phosphorylation. Accordingly, utilities of VGAM101 include diagnosis, prevention and treatment of diseases

and clinical conditions associated with ANGPT1. The function of ANGPT1 has been established by previous studies. By FISH and radiation hybrid analysis, Cheung et al. (1998) mapped the ANGPT1 gene to 8q22.3–q23. By FISH, Valenzuela et al. (1999) mapped the ANGPT1 gene to 8q22 in a region that shows homology of synteny to mouse chromosome 15, where they mapped the mouse Angpt1 gene. However, by indirect in situ PCR and FISH, Marziliano et al. (1999) mapped the Angpt1 gene in the mouse to chromosome 9E2. To explore the possibility that VEGF and angiopoietins collaborate during tumor angiogenesis, Holash et al. (1999) analyzed several different murine and human tumor models. The apparent association of tumor vessel regression, apoptosis, and disruption of endothelial cell interactions with support cells in rat C6 gliomas raised the possibility that blockade of the stabilizing action of Ang1 might be contributing to tumor vessel regression. Consistent with this possibility, Holash et al. (1999) noted that angiopoietin–1 was antiapoptotic for cultured endothelial cells and expression of its antagonist angiopoietin–2 was induced in the endothelium of co-opted tumor vessels before their regression. Diffuse angiopoietin–1 expression in human tumors resembled that seen in the rat model.

Holash et al. (1999) suggested that a subset of tumors rapidly co-opts existing host vessels to form an initially well vascularized tumor mass. Perhaps as part of a host defense mechanism there is widespread regression of these initially co-opted vessels, leading to a secondarily avascular tumor and a massive tumor cell loss. However, the remaining tumor is ultimately rescued by robust angiogenesis at the tumor margin. Animal model experiments lend further support to the function of ANGPT1. Suri et al. (1996) showed that mice engineered to lack angiopoietin-1 display angiogenic defects reminiscent of those previously seen in mice lacking Tie2, demonstrating that angiopoietin-1 is a primary physiologic ligand for Tie2 and that it has critical in vivo angiogenic actions that are distinct from vascular endothelial growth factor (VEGF; 192240) and that are not reflected in the classic in vitro assays used to characterize VEGF. They concluded that angiopoietin-1 appears to play a crucial role in mediating reciprocal interactions between the endothelium and surrounding matrix and mesenchyme.

[2893] It is appreciated that the abovementioned animal model for ANGPT1 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further ap-

preciated from the publications sited hereinbelow.

[2894] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[2897] Further studies establishing the function and utilities of ANGPT1 are found in John Hopkins OMIM database record ID 601667, and in sited publications numbered 2124–2126, 2373, 2127–2130, 237 and 2328 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. G Protein–coupled Receptor 61 (GPR61, Accession XM_086232) is another VGAM101 host target gene. GPR61 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by GPR61, corresponding to a HOST

TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GPR61 BINDING SITE, designated SEQ ID:3123, to the nucleotide sequence of VGAM101 RNA, herein designated VGAM RNA, also designated SEQ ID:436.

[2898] Another function of VGAM101 is therefore inhibition of G Protein-coupled Receptor 61 (GPR61, Accession XM_086232), a gene which transduces extracellular signals through heterotrimeric G proteins. Accordingly, utilities of VGAM101 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GPR61. The function of GPR61 has been established by previous studies. By PCR of genomic DNA, Lee et al. (2001) obtained a partial GPR61 clone using primers designed from the sequence of a rabbit G protein-coupled receptor (GPCR). They used the PCR products to screen a human brain cDNA library and found that GPR61 encodes a 417-amino acid protein that shares over 80% identity with the rabbit homolog and 44% similarity with GPR62 (OMIM Ref. No. 606917) in the transmembrane region. By Northern blot analysis of human brain areas, Lee et al. (2001) detected a 4.3-kb transcript in caudate, putamen,

and thalamus, but not in hypothalamus, hippocampus, pons, frontal cortex, or cerebellum. No expression was found in liver or kidney. Lee et al. (2001) also cloned rat GPR61 and, by in situ hybridization, found widespread expression in rat brain. Cikos et al. (2001) independently cloned GPR61, which they called BALGR. A partial sequence was obtained by RT-PCR of human brain mRNA using degenerate oligonucleotides corresponding to a transmembrane sequence of GPR30 (OMIM Ref. No. 601805). They cloned the full-length cDNA from a hypothalamus cDNA library. They found that the deduced protein contains 451 amino acids and has a calculated molecular mass of about 49 kD. GPR61 contains 7 putative transmembrane domains, a potential N-glycosylation site, cysteine residues that may form a disulfide bridge, and several putative protein kinase sites. It also contains a conserved glu-arg-tyr sequence shared with other GPCRs. The highest sequence similarity (OMIM Ref. No. 28–31%) was found with biogenic amine GPCRs, i.e., serotonin, histamine, adrenergic, and dopamine GPCRs. By semiquantitative PCR of multiple human tissues, Cikos et al. (2001) found highest expression in brain and testes and low but detectable expression in all other tissues examined. Their

results of Northern blot analysis of human brain regions differed from that reported by Lee et al. (2001). Strong expression of a 4.8-kb transcript was found in cerebral cortex, occipital pole, frontal lobe, temporal lobe, amygdala, and hippocampus, and lower expression in putamen and caudate nucleus. No message was detected in cerebellum, medulla oblongata, spinal cord, corpus callosum, substantia nigra, subthalamic nucleus, or thalamus.

[2899] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[2900] Cikos, S.; Gregor, P.; Koppel, J. : Cloning of a novel biogenic amine receptor-like G protein-coupled receptor expressed in human brain. *Biochim. Biophys. Acta* 1521: 66-72, 2001. ; and

[2901] Lee, D. K.; George, S. R.; Cheng, R.; Nguyen, T.; Liu, Y.; Brown, M.; Lynch, K. R.; O'Dowd, B. F. : Identification of four novel human G protein-coupled receptors expressed in the brain.

[2902] Further studies establishing the function and utilities of GPR61 are found in John Hopkins OMIM database record ID 606916, and in cited publications numbered 1254 listed in the bibliography section hereinbelow, which are

also hereby incorporated by reference. Protein Phosphatase 1, Regulatory (inhibitor) Subunit 12B (PPP1R12B, Accession NM_032105) is another VGAM101 host target gene. PPP1R12B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PPP1R12B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PPP1R12B BINDING SITE, designated SEQ ID:2228, to the nucleotide sequence of VGAM101 RNA, herein designated VGAM RNA, also designated SEQ ID:436.

[2903] Another function of VGAM101 is therefore inhibition of Protein Phosphatase 1, Regulatory (inhibitor) Subunit 12B (PPP1R12B, Accession NM_032105). Accordingly, utilities of VGAM101 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPP1R12B. Tripartite Motif-containing 9 (TRIM9, Accession NM_015163) is another VGAM101 host target gene. TRIM9 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TRIM9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of TRIM9 BINDING SITE, designated SEQ ID:1610, to the nucleotide sequence of VGAM101 RNA, herein designated VGAM RNA, also designated SEQ ID:436.

[2904] Another function of VGAM101 is therefore inhibition of Tripartite Motif-containing 9 (TRIM9, Accession NM_015163), a gene which may function as a positive regulator for mannosylphosphate transferase and is required to mediate mannosylphosphate transfer in both the core and outer chain portions of n-linked oligosaccharides. Accordingly, utilities of VGAM101 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRIM9. The function of TRIM9 has been established by previous studies. TRIM proteins are composed of 3 zinc-binding domains, a RING, a B-box type 1, and a B-box type 2, followed by a coiled-coil region. They are involved in development and cell growth. By EST database searching for B-box-containing proteins, Reymond et al. (2001) identified 37 TRIM members, including 3 isoforms of TRIM9. Northern blot analysis revealed high expression of a 4.4-kb TRIM9 transcript in brain. Fluorescence microscopy demonstrated expression of TRIM9 in cytoplasmic speckles. Interaction mating

analysis indicated that TRIM9 can form a homodimer.

[2905] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[2906] Li, Y.; Chin, L.-S.; Weigel, C.; Li, L. : Spring, a novel RING finger protein that regulates synaptic vesicle exocytosis. *J. Biol. Chem.* 276: 40824–40833, 2001. ; and

[2907] Reymond, A.; Meroni, G.; Fantozzi, A.; Merla, G.; Cairo, S.; Luzi, L.; Riganelli, D.; Zanaria, E.; Messali, S.; Cainarca, S.; Guffanti, A.; Minucci, S.; Pelicci, P. G.; Ballabio, A. :.

[2908] Further studies establishing the function and utilities of TRIM9 are found in John Hopkins OMIM database record ID 606555, and in cited publications numbered 1009–1010 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Tyrosine 3-monooxygenase/tryptophan 5-monooxygenase Activation Protein, Epsilon Polypeptide (YWHA_E, Accession NM_006761) is another VGAM101 host target gene. YWHA_E BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by YWHA_E, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of YWHAE BINDING SITE, designated SEQ ID:1329, to the nucleotide sequence of VGAM101 RNA, herein designated VGAM RNA, also designated SEQ ID:436.

[2909] Another function of VGAM101 is therefore inhibition of Tyrosine 3-monooxygenase/tryptophan 5-monooxygenase Activation Protein, Epsilon Polypeptide (YWHAE, Accession NM_006761), a gene which binds to cdc25 and may facilitate cdc25 interaction with Raf-1 in vivo. Accordingly, utilities of VGAM101 include diagnosis, prevention and treatment of diseases and clinical conditions associated with YWHAE. The function of YWHAE has been established by previous studies. Using a yeast 2-hybrid screen to probe a HeLa cell library with CDC25A (OMIM Ref. No. 116947) and CDC25B (OMIM Ref. No. 116949) as bait, Conklin et al. (1995) isolated cDNAs encoding YWHAB (OMIM Ref. No. 601289), which they called 14-3-3-beta, and YWHAE, which they called 14-3-3-epsilon. YWHAE encodes a deduced 260-amino acid protein that is 100% identical to the mouse sequence. Both 14-3-3 proteins interacted with either CDC protein but did not affect their phosphatase activities. Like YWHAB, YWHAE interacted with RAF1 (OMIM Ref. No.

164760) but not RAS (OMIM Ref. No. 190020) in yeast 2-hybrid screens and may facilitate the association of CDC25 with RAF1. The binding of insulin (OMIM Ref. No. 176730) to its receptor induces the phosphorylation of the cytosolic substrates IRS1 (OMIM Ref. No. 147545) and IRS2 (OMIM Ref. No. 600797), which associate with several Src homology-2 (SH2) domain-containing proteins. To identify unique IRS1-binding proteins, Ogihara et al. (1997) screened a human heart cDNA expression library with recombinant IRS1. They obtained 2 isoforms of the 14-3-3 protein family, 14-3-3-zeta (YWHAZ; 601288) and -epsilon. 14-3-3 protein has been shown to associate with IRS1 in L6 myotubes, HepG2 hepatoma cells, Chinese hamster ovary cells, and bovine brain tissue. IRS2, a protein structurally similar to IRS1, was also shown to form a complex with 14-3-3 protein using a baculovirus expression system. The amount of 14-3-3 protein associated with IRS1 was not affected by insulin stimulation but was increased significantly by treatment with okadaic acid, a potent serine/threonine phosphatase inhibitor. The authors identified a putative 14-3-3 protein-binding site within the phosphotyrosine-binding (PTB) domain of IRS1. Ogihara et al. (1997) suggested that the association with

14-3-3 protein may play a role in the regulation of insulin sensitivity by interrupting the association between the insulin receptor and IRS1.

- [2910] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:
- [2911] Conklin, D. S.; Galaktionov, K.; Beach, D. : 14-3-3 proteins associate with cdc25 phosphatases. Proc. Nat. Acad. Sci. 92: 7892-7896, 1995. ; and
- [2912] Ogihara, T.; Isobe, T.; Ichimura, T.; Taoka, M.; Funaki, M.; Sakoda, H.; Onishi, Y.; Inukai, K.; Anai, M.; Fukushima, Y.; Kikuchi, M.; Yazaki, Y.; Oka, Y.; Asano, T. : 14-3-3 protein bin.
- [2913] Further studies establishing the function and utilities of YWHAE are found in John Hopkins OMIM database record ID 605066, and in cited publications numbered 1577-1578, 2285-158 and 1001 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. A Kinase (PRKA) Anchor Protein (yotiao) 9 (AKAP9, Accession NM_005751) is another VGAM101 host target gene. AKAP9 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by AKAP9, corresponding to a HOST TARGET

binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AKAP9 BINDING SITE, designated SEQ ID:1242, to the nucleotide sequence of VGAM101 RNA, herein designated VGAM RNA, also designated SEQ ID:436.

[2914] Another function of VGAM101 is therefore inhibition of A Kinase (PRKA) Anchor Protein (yotiao) 9 (AKAP9, Accession NM_005751). Accordingly, utilities of VGAM101 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AKAP9. LOC166824 (Accession XM_094119) is another VGAM101 host target gene. LOC166824 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC166824, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC166824 BINDING SITE, designated SEQ ID:3259, to the nucleotide sequence of VGAM101 RNA, herein designated VGAM RNA, also designated SEQ ID:436.

[2915] Another function of VGAM101 is therefore inhibition of LOC166824 (Accession XM_094119). Accordingly, utilities

of VGAM101 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC166824. LOC254835 (Accession XM_173056) is another VGAM101 host target gene. LOC254835 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC254835, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254835 BINDING SITE, designated SEQ ID:3722, to the nucleotide sequence of VGAM101 RNA, herein designated VGAM RNA, also designated SEQ ID:436.

[2916] Another function of VGAM101 is therefore inhibition of LOC254835 (Accession XM_173056). Accordingly, utilities of VGAM101 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254835. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 102 (VGAM102) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[2917] VGAM102 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM102 was detected is described hereinabove with reference to Figs. 1–8.

[2918] VGAM102 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM102 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[2919] VGAM102 gene encodes a VGAM102 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM102 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM102 precursor RNA is designated SEQ ID:88, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:88 is located at position 41122 relative to the genome of Vaccinia Virus.

[2920] VGAM102 precursor RNA folds onto itself, forming VGAM102 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this

`hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[2921] An enzyme complex designated DICER COMPLEX, `dices` the VGAM102 folded precursor RNA into VGAM102 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 73%) nucleotide sequence of VGAM102 RNA is designated SEQ ID:437, and is provided hereinbelow with reference to the sequence listing part.

[2922] VGAM102 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM102 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM102 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN

CODING and 3`UTR respectively.

[2923] VGAM102 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM102 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM102 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM102 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM102 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[2924] The complementary binding of VGAM102 RNA, herein designated VGAM RNA, to host target binding sites on VGAM102 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM102 host target RNA into VGAM102 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[2925] It is appreciated that VGAM102 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM102 host target genes. The mRNA of each one of this plurality of VGAM102 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM102 RNA, herein designated VGAM RNA, and which when bound by VGAM102 RNA causes inhibition of translation of respective one or more VGAM102 host target proteins.

[2926] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM102 gene, herein designated VGAM GENE, on one or more VGAM102 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[2927] It is yet further appreciated that a function of VGAM102 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM102 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM102 correlate with, and may be deduced from, the identity of the host target genes which VGAM102 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[2928] Nucleotide sequences of the VGAM102 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the
`diced` VGAM102 RNA, herein designated VGAM RNA,
and a schematic representation of the secondary folding
of VGAM102 folded precursor RNA, herein designated
VGAM FOLDED PRECURSOR RNA, of VGAM102 are further
described hereinbelow with reference to Table 1.

[2929] Nucleotide sequences of host target binding sites, such as
BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of
Fig. 1, found on VGAM102 host target RNA, and schematic
representation of the complementarity of each of these
host target binding sites to VGAM102 RNA, herein desig-
nated VGAM RNA, are described hereinbelow with refer-
ence to Table 2.

[2930] As mentioned hereinabove with reference to Fig. 1, a
function of VGAM102 gene, herein designated VGAM is
inhibition of expression of VGAM102 target genes. It is
appreciated that specific functions, and accordingly utili-
ties, of VGAM102 correlate with, and may be deduced
from, the identity of the target genes which VGAM102
binds and inhibits, and the function of these target genes,
as elaborated hereinbelow.

[2931] PNPASE (Accession XM_048088) is a VGAM102 host target
gene. PNPASE BINDING SITE is HOST TARGET binding site

found in the 3' untranslated region of mRNA encoded by PNPASE, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PNPASE BINDING SITE, designated SEQ ID:2900, to the nucleotide sequence of VGAM102 RNA, herein designated VGAM RNA, also designated SEQ ID:437.

[2932] A function of VGAM102 is therefore inhibition of PNPASE (Accession XM_048088). Accordingly, utilities of VGAM102 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PNPASE. SEC24 Related Gene Family, Member D (*S. cerevisiae*) (SEC24D, Accession NM_014822) is another VGAM102 host target gene. SEC24D BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SEC24D, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SEC24D BINDING SITE, designated SEQ ID:1559, to the nucleotide sequence of VGAM102 RNA, herein designated VGAM RNA, also designated SEQ ID:437.

[2933] Another function of VGAM102 is therefore inhibition of SEC24 Related Gene Family, Member D (*S. cerevisiae*) (SEC24D, Accession NM_014822). Accordingly, utilities of VGAM102 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SEC24D. LOC131000 (Accession XM_067145) is another VGAM102 host target gene. LOC131000 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC131000, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC131000 BINDING SITE, designated SEQ ID:3037, to the nucleotide sequence of VGAM102 RNA, herein designated VGAM RNA, also designated SEQ ID:437.

[2934] Another function of VGAM102 is therefore inhibition of LOC131000 (Accession XM_067145). Accordingly, utilities of VGAM102 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC131000. LOC151658 (Accession XM_098103) is another VGAM102 host target gene. LOC151658 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC151658, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151658 BINDING SITE, designated SEQ ID:3349, to the nucleotide sequence of VGAM102 RNA, herein designated VGAM RNA, also designated SEQ ID:437.

[2935] Another function of VGAM102 is therefore inhibition of LOC151658 (Accession XM_098103). Accordingly, utilities of VGAM102 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151658. LOC257428 (Accession XM_168584) is another VGAM102 host target gene. LOC257428 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC257428, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257428 BINDING SITE, designated SEQ ID:3649, to the nucleotide sequence of VGAM102 RNA, herein designated VGAM RNA, also designated SEQ ID:437.

[2936] Another function of VGAM102 is therefore inhibition of LOC257428 (Accession XM_168584). Accordingly, utilities of VGAM102 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LOC257428. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 103 (VGAM103) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[2937] VGAM103 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM103 was detected is described hereinabove with reference to Figs. 1–8.

[2938] VGAM103 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM103 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[2939] VGAM103 gene encodes a VGAM103 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM103 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM103 precursor RNA is designated SEQ

ID:89, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:89 is located at position 42559 relative to the genome of Vaccinia Virus.

[2940] VGAM103 precursor RNA folds onto itself, forming VGAM103 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[2941] An enzyme complex designated DICER COMPLEX, `dices` the VGAM103 folded precursor RNA into VGAM103 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 74%) nucleotide sequence of VGAM103 RNA is designated SEQ ID:438, and is provided hereinbelow with reference to the sequence list-

ing part.

[2942] VGAM103 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM103 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM103 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[2943] VGAM103 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM103 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM103 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM103 RNA, herein designated VGAM RNA, may

have a different number of host target binding sites in untranslated regions of a VGAM103 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[2944] The complementary binding of VGAM103 RNA, herein designated VGAM RNA, to host target binding sites on VGAM103 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM103 host target RNA into VGAM103 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[2945] It is appreciated that VGAM103 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM103 host target genes. The mRNA of each one of this plurality of VGAM103 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM103 RNA, herein designated VGAM

RNA, and which when bound by VGAM103 RNA causes inhibition of translation of respective one or more VGAM103 host target proteins.

[2946] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM103 gene, herein designated VGAM GENE, on one or more VGAM103 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[2947] It is yet further appreciated that a function of VGAM103 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM103 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM103 correlate with, and may be deduced from, the identity of the host target genes which VGAM103 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[2948] Nucleotide sequences of the VGAM103 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM103 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM103 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM103 are further described hereinbelow with reference to Table 1.

[2949] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM103 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM103 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[2950] As mentioned hereinabove with reference to Fig. 1, a function of VGAM103 gene, herein designated VGAM is

inhibition of expression of VGAM103 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM103 correlate with, and may be deduced from, the identity of the target genes which VGAM103 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[2951] Caspase Recruitment Domain Family, Member 15 (CARD15, Accession NM_022162) is a VGAM103 host target gene. CARD15 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CARD15, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CARD15 BINDING SITE, designated SEQ ID:1983, to the nucleotide sequence of VGAM103 RNA, herein designated VGAM RNA, also designated SEQ ID:438.

[2952] A function of VGAM103 is therefore inhibition of Caspase Recruitment Domain Family, Member 15 (CARD15, Accession NM_022162), a gene which serves as an intracellular receptor for bacterial products in monocytes and transduces signals leading to NF κ B activation. Accordingly, utilities of VGAM103 include diagnosis, prevention and

treatment of diseases and clinical conditions associated with CARD15. The function of CARD15 has been established by previous studies. By searching a genomic database for NOD1 homologs, followed by 5-prime RACE and RT-PCR, Ogura et al. (2001) obtained cDNAs encoding NOD2. Sequence analysis predicted that the 1,040-amino acid NOD2 protein, which is 34% identical to NOD1, contains 2 N-terminal CARDs fused to a central NBD domain followed by 10 tandem LRRs. Ogura et al. (2001) also identified a NOD2 variant encoding a 1,013-amino acid protein, which they called NOD2B. Northern blot analysis detected 7.0- and 5.5-kb NOD2 transcripts in peripheral blood leukocytes, with little or no expression found in other tissues. RT-PCR analysis revealed expression primarily in monocytes. In contrast, NOD1 and APAF1 are broadly expressed. Expression of NOD2 or NOD2B resulted in NF κ B activation, and mutants lacking the LRRs had enhanced NF κ B activation. The authors determined that both intact CARD domains are necessary and sufficient for IKK-gamma (IKBKG; 300248)- and RICK (RIPK2; 603455)-dependent NF κ B activation. Coimmunoprecipitation analysis showed that the CARD domain of RICK interacts with the CARD domains of

NOD2. Lesage et al. (2002) reported the mutational analysis of the CARD15 gene in 453 patients with Crohn disease, including 166 sporadic and 287 familial cases, 159 patients with ulcerative colitis (OMIM Ref. No. 191390), and 103 healthy control subjects. Although no mutations were found to be associated with ulcerative colitis, 50% of patients with Crohn disease carried at least 1 potential disease-causing mutation, including 17% who had a double mutation. There were 27 rare additional mutations. Each of 3 polymorphisms (R702W, G908R, and 1007fs) were confirmed to be intermittently associated with susceptibility to Crohn disease. These 3 main variants represented 32%, 18%, and 31%, respectively, of the total Crohn disease mutations, whereas the total of the 27 rare mutations represented 19% of disease-causing mutations. Altogether, 93% of the mutations were located in the distal third of the gene. These observations confirmed the gene-dosage effect in Crohn disease. Patients with double-dose mutations were characterized by a younger age at onset, a more frequent stricturing phenotype, and a less frequent colonic involvement than were seen in those patients who had no mutation. The severity of the disease and extraintestinal manifestations were not different for

any of the CARD15 genotypes. The proportion of familial and sporadic cases and the proportion of patients with smoking habits were similar in the groups of Crohn disease patients with or without mutation.

[2953] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[2954] Ogura, Y.; Inohara, N.; Benito, A.; Chen, F. F.; Yamaoka, S.; Nunez, G. : Nod2, a Nod1/Apaf-1 family member that is restricted to monocytes and activates NF-kappa-B. J. Biol. Chem. 276: 4812-4818, 2001. ; and

[2955] Vermeire, S.; Wild, G.; Kocher, K.; Cousineau, J.; Dufresne, L.; Bitton, A.; Langelier, D.; Pare, P.; Lapointe, G.; Cohen, A.; Daly, M. J.; Rioux, J. D. : CARD15 genetic variation in a.

[2956] Further studies establishing the function and utilities of CARD15 are found in John Hopkins OMIM database record ID 605956, and in cited publications numbered 1568-1569, 1573, 2284-157 and 1574-1576 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Chloride Channel 4 (CLCN4, Accession NM_001830) is another VGAM103 host target gene. CLCN4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded

by CLCN4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CLCN4 BINDING SITE, designated SEQ ID:861, to the nucleotide sequence of VGAM103 RNA, herein designated VGAM RNA, also designated SEQ ID:438.

[2957] Another function of VGAM103 is therefore inhibition of Chloride Channel 4 (CLCN4, Accession NM_001830), a gene which is regulation of cell volume; membrane potential stabilization, signal transduction and transepithelial transport. Accordingly, utilities of VGAM103 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CLCN4. The function of CLCN4 has been established by previous studies. In the course of constructing a comprehensive transcript map of the Xp22.3 region, van Slegtenhorst et al. (1994) identified an evolutionarily conserved CpG island and cloned the corresponding gene. The predicted 760-amino acid protein contained 12 hydrophobic domains and shared sequence and structural similarities with all the previously isolated members of the family of voltage-gated chloride channels. The gene, termed CLCN4, for chloride channel 4,

contained at least 10 exons spanning 60 to 80 kb. In contrast with most genes isolated from the Xp22.3 region, CLCN4 did not share homology with the Y chromosome, but was conserved in mouse and hamster. Expression studies demonstrated a 7.5-kb transcript that is particularly abundant in skeletal muscle and also detectable in brain and heart. Thus, this gene encodes a newly identified voltage-gated chloride channel. Rugarli et al. (1995) found that in the wild Mediterranean mouse *Mus spretus*, the *Cln4* gene maps to the X chromosome as it does in the human; however, in the inbred strain of laboratory mouse C57BL/6J, they found that it maps to chromosome 7. Findings indicated that a recent evolutionary rearrangement occurred in the mouse sex chromosomes very close to the pseudoautosomal region (PAR). The data were considered molecular evidence for a major divergence near the pseudoautosomal region consistent with the hypothesis that hybrid sterility in these species results from abnormal pairing of sex chromosomes during male meiosis. They found that *Cln4* is the closest cloned gene to the *M. spretus* pseudoautosomal region and the most distal locus displaying a conserved position between the human and this mouse locus. The X-inactivation status of the locus in

M. spretus was demonstrated by the finding that in F1 females from a cross between M. spretus and an inbred-derived mouse carrying the t(X;16)16H balanced translocation, it was always the normal M. spretus X chromosome that was inactive in adult tissues. This completely skewed X inactivation provided a system for assaying expression of genes from the inactive X chromosome once the parental alleles could be distinguished. Palmer et al. (1995) likewise found what they referred to as 'contravention of Ohno's law' in the course of mapping a cDNA mouse Cln4 in an interspecific backcross. This was the first example of a gene unique to the X chromosome in 1 eutherian species but autosomal in another. The consequence of this chromosomal rearrangement was that the gene was lost by mendelian segregation in a subset of the male progeny of a (C57BL/6 x Mus spretus) x Mus spretus backcross.

[2958] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[2959] Rugarli, E. I.; Adler, D. A.; Borsani, G.; Tsuchiya, K.; Franco, B.; Hauge, X.; Disteché, C.; Chapman, V.; Ballabio, A. : Different chromosomal localization of the Clcn4 gene

in *Mus spretus* and C57BL/6J mice. *Nature Genet.* 10: 466–471, 1995. ; and

[2961] Further studies establishing the function and utilities of CLCN4 are found in John Hopkins OMIM database record ID 302910, and in cited publications numbered 248 and 2530–2537 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Fibroblast Growth Factor 2 (basic) (FGF2, Accession NM_002006) is another VGAM103 host target gene. FGF2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FGF2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FGF2 BINDING SITE, designated SEQ ID:885, to the nucleotide sequence of VGAM103 RNA, herein designated VGAM RNA, also designated SEQ ID:438.

[2962] Another function of VGAM103 is therefore inhibition of Fibroblast Growth Factor 2 (basic) (FGF2, Accession

NM_002006), a gene which Basic fibroblast growth factor 2. Accordingly, utilities of VGAM103 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FGF2. The function of FGF2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM30. Zinc Finger Protein 135 (clone pHZ-17) (ZNF135, Accession NM_003436) is another VGAM103 host target gene. ZNF135 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ZNF135, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF135 BINDING SITE, designated SEQ ID:1022, to the nucleotide sequence of VGAM103 RNA, herein designated VGAM RNA, also designated SEQ ID:438.

[2963] Another function of VGAM103 is therefore inhibition of Zinc Finger Protein 135 (clone pHZ-17) (ZNF135, Accession NM_003436). Accordingly, utilities of VGAM103 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF135. SEC15B (Accession XM_039570) is another VGAM103 host target

gene. SEC15B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SEC15B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SEC15B BINDING SITE, designated SEQ ID:2757, to the nucleotide sequence of VGAM103 RNA, herein designated VGAM RNA, also designated SEQ ID:438.

[2964] Another function of VGAM103 is therefore inhibition of SEC15B (Accession XM_039570). Accordingly, utilities of VGAM103 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SEC15B. Zinc Finger Protein 334 (ZNF334, Accession NM_018102) is another VGAM103 host target gene. ZNF334 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ZNF334, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF334 BINDING SITE, designated SEQ ID:1780, to the nucleotide sequence of VGAM103 RNA, herein designated VGAM RNA, also designated SEQ ID:438.

[2965] Another function of VGAM103 is therefore inhibition of Zinc Finger Protein 334 (ZNF334, Accession NM_018102). Accordingly, utilities of VGAM103 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF334. LOC158954 (Accession XM_017340) is another VGAM103 host target gene. LOC158954 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC158954, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158954 BINDING SITE, designated SEQ ID:2567, to the nucleotide sequence of VGAM103 RNA, herein designated VGAM RNA, also designated SEQ ID:438.

[2966] Another function of VGAM103 is therefore inhibition of LOC158954 (Accession XM_017340). Accordingly, utilities of VGAM103 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158954. LOC219686 (Accession XM_165544) is another VGAM103 host target gene. LOC219686 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC219686, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219686 BINDING SITE, designated SEQ ID:3500, to the nucleotide sequence of VGAM103 RNA, herein designated VGAM RNA, also designated SEQ ID:438.

[2967] Another function of VGAM103 is therefore inhibition of LOC219686 (Accession XM_165544). Accordingly, utilities of VGAM103 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219686. LOC221510 (Accession XM_165807) is another VGAM103 host target gene. LOC221510 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221510, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221510 BINDING SITE, designated SEQ ID:3508, to the nucleotide sequence of VGAM103 RNA, herein designated VGAM RNA, also designated SEQ ID:438.

[2968] Another function of VGAM103 is therefore inhibition of LOC221510 (Accession XM_165807). Accordingly, utilities of VGAM103 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LOC221510. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 104 (VGAM104) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[2969] VGAM104 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM104 was detected is described hereinabove with reference to Figs. 1–8.

[2970] VGAM104 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus. VGAM104 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[2971] VGAM104 gene encodes a VGAM104 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM104 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM104 precursor RNA is designated SEQ

ID:90, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:90 is located at position 44309 relative to the genome of Vaccinia Virus.

[2972] VGAM104 precursor RNA folds onto itself, forming VGAM104 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[2973] An enzyme complex designated DICER COMPLEX, `dices` the VGAM104 folded precursor RNA into VGAM104 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of VGAM104 RNA is designated SEQ ID:439, and is provided hereinbelow with reference to the sequence list-

ing part.

[2974] VGAM104 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM104 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM104 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[2975] VGAM104 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM104 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM104 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM104 RNA, herein designated VGAM RNA, may

have a different number of host target binding sites in untranslated regions of a VGAM104 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[2976] The complementary binding of VGAM104 RNA, herein designated VGAM RNA, to host target binding sites on VGAM104 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM104 host target RNA into VGAM104 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[2977] It is appreciated that VGAM104 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM104 host target genes. The mRNA of each one of this plurality of VGAM104 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM104 RNA, herein designated VGAM

RNA, and which when bound by VGAM104 RNA causes inhibition of translation of respective one or more VGAM104 host target proteins.

[2978] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM104 gene, herein designated VGAM GENE, on one or more VGAM104 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[2979] It is yet further appreciated that a function of VGAM104 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM104 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM104 correlate with, and may be deduced from, the identity of the host target genes which VGAM104 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[2980] Nucleotide sequences of the VGAM104 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM104 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM104 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM104 are further described hereinbelow with reference to Table 1.

[2981] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM104 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM104 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[2982] As mentioned hereinabove with reference to Fig. 1, a function of VGAM104 gene, herein designated VGAM is

inhibition of expression of VGAM104 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM104 correlate with, and may be deduced from, the identity of the target genes which VGAM104 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[2983] Phospholamban (PLN, Accession NM_002667) is a VGAM104 host target gene. PLN BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PLN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PLN BINDING SITE, designated SEQ ID:947, to the nucleotide sequence of VGAM104 RNA, herein designated VGAM RNA, also designated SEQ ID:439.

[2984] A function of VGAM104 is therefore inhibition of Phospholamban (PLN, Accession NM_002667), a gene which regulates the activity of the calcium pump of cardiac sarcoplasmic reticulum. Accordingly, utilities of VGAM104 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PLN. The function of PLN has been established by previous studies. Fujii et

al. (1991) isolated and characterized genomic DNA clones encoding rabbit phospholamban. The phospholamban gene of 13.2 kb contained only one 10.5-kb intron which separated exonic sequences located in the 5-prime untranslated region. Phospholamban, through modulation of sarcoplasmic reticulum calcium-ATPase activity, is a key regulator of cardiac diastolic function. Alterations in phospholamban expression may define parameters of muscle relaxation. McTiernan et al. (1999) observed that human ventricle and quadriceps displayed high levels of phospholamban transcripts and proteins, with markedly lower expression observed in smooth muscles, while the right atrium also expressed low levels of phospholamban. The structure of the human phospholamban gene closely resembles that reported for chicken, rabbit, rat, and mouse. Comparison of the human to other mammalian phospholamban genes indicated a marked conservation of sequence for at least 217 bp upstream of the transcription start site.

[2985] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[2986] Fujii, J.; Zarain-Herzberg, A.; Willard, H. F.; Tada, M.;

MacLennan, D. H. : Structure of the rabbit phospholamban gene, cloning of the human cDNA, and assignment of the gene to human chromosome 6. J. Biol. Chem. 266: 11669–11675, 1991. ; and

[2987] McTiernan, C. F.; Frye, C. S.; Lemster, B. H.; Kinder, E. A.; Ogletree–Hughes, M. L.; Moravec, C. S.; Feldman, A. M. : The human phospholamban gene: structure and expression. J. Molec. Cell.

[2988] Further studies establishing the function and utilities of PLN are found in John Hopkins OMIM database record ID 172405, and in cited publications numbered 2485–2487 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Proline–rich Gla (G–carboxyglutamic acid) Polypeptide 1 (PRRG1, Accession NM_000950) is another VGAM104 host target gene. PRRG1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PRRG1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRRG1 BINDING SITE, designated SEQ ID:789, to the nucleotide sequence of VGAM104 RNA, herein designated VGAM RNA, also designated SEQ ID:439.

[2989] Another function of VGAM104 is therefore inhibition of Proline-rich Gla (G-carboxyglutamic acid) Polypeptide 1 (PRRG1, Accession NM_000950). Accordingly, utilities of VGAM104 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRRG1. LOC149320 (Accession XM_047557) is another VGAM104 host target gene. LOC149320 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC149320, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149320 BINDING SITE, designated SEQ ID:2892, to the nucleotide sequence of VGAM104 RNA, herein designated VGAM RNA, also designated SEQ ID:439.

[2990] Another function of VGAM104 is therefore inhibition of LOC149320 (Accession XM_047557). Accordingly, utilities of VGAM104 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149320. LOC163782 (Accession XM_089138) is another VGAM104 host target gene. LOC163782 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC163782, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC163782 BINDING SITE, designated SEQ ID:3234, to the nucleotide sequence of VGAM104 RNA, herein designated VGAM RNA, also designated SEQ ID:439.

[2991] Another function of VGAM104 is therefore inhibition of LOC163782 (Accession XM_089138). Accordingly, utilities of VGAM104 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC163782. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 105 (VGAM105) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[2992] VGAM105 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM105 was detected is described hereinabove with reference to Figs. 1–8.

[2993] VGAM105 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM105 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[2994] VGAM105 gene encodes a VGAM105 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM105 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM105 precursor RNA is designated SEQ ID:91, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:91 is located at position 44202 relative to the genome of Vaccinia Virus.

[2995] VGAM105 precursor RNA folds onto itself, forming VGAM105 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[2996] An enzyme complex designated DICER COMPLEX, `dices`

the VGAM105 folded precursor RNA into VGAM105 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 70%) nucleotide sequence of VGAM105 RNA is designated SEQ ID:440, and is provided hereinbelow with reference to the sequence listing part.

[2997] VGAM105 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM105 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM105 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[2998] VGAM105 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM105 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM105 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM105 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM105 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[2999] The complementary binding of VGAM105 RNA, herein designated VGAM RNA, to host target binding sites on VGAM105 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM105 host target RNA into VGAM105 host target protein, herein desig-

nated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[3000] It is appreciated that VGAM105 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM105 host target genes. The mRNA of each one of this plurality of VGAM105 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM105 RNA, herein designated VGAM RNA, and which when bound by VGAM105 RNA causes inhibition of translation of respective one or more VGAM105 host target proteins.

[3001] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM105 gene, herein designated VGAM GENE, on one or more VGAM105 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[3002] It is yet further appreciated that a function of VGAM105 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM105 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM105 correlate with, and may be deduced from, the identity of the host target genes which VGAM105 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[3003] Nucleotide sequences of the VGAM105 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM105 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM105 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM105 are further described hereinbelow with reference to Table 1.

[3004] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM105 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM105 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[3005] As mentioned hereinabove with reference to Fig. 1, a function of VGAM105 gene, herein designated VGAM is inhibition of expression of VGAM105 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM105 correlate with, and may be deduced from, the identity of the target genes which VGAM105 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[3006] FLJ12668 (Accession NM_024997) is a VGAM105 host target gene. FLJ12668 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ12668, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12668 BINDING SITE, designated SEQ ID:2123, to the nucleotide sequence of VGAM105

RNA, herein designated VGAM RNA, also designated SEQ ID:440.

[3007] A function of VGAM105 is therefore inhibition of FLJ12668 (Accession NM_024997). Accordingly, utilities of VGAM105 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12668. KIAA0016 (Accession NM_014765) is another VGAM105 host target gene. KIAA0016 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0016, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0016 BINDING SITE, designated SEQ ID:1542, to the nucleotide sequence of VGAM105 RNA, herein designated VGAM RNA, also designated SEQ ID:440.

[3008] Another function of VGAM105 is therefore inhibition of KIAA0016 (Accession NM_014765). Accordingly, utilities of VGAM105 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0016. ZAK (Accession NM_016653) is another VGAM105 host target gene. ZAK BINDING SITE is HOST TARGET binding site found in the 3' untranslated region

of mRNA encoded by ZAK, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZAK BINDING SITE, designated SEQ ID:1708, to the nucleotide sequence of VGAM105 RNA, herein designated VGAM RNA, also designated SEQ ID:440.

[3009] Another function of VGAM105 is therefore inhibition of ZAK (Accession NM_016653). Accordingly, utilities of VGAM105 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZAK. LOC58489 (Accession XM_051862) is another VGAM105 host target gene. LOC58489 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC58489, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC58489 BINDING SITE, designated SEQ ID:2952, to the nucleotide sequence of VGAM105 RNA, herein designated VGAM RNA, also designated SEQ ID:440.

[3010] Another function of VGAM105 is therefore inhibition of LOC58489 (Accession XM_051862). Accordingly, utilities

of VGAM105 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC58489. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 106 (VGAM106) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[3011] VGAM106 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM106 was detected is described hereinabove with reference to Figs. 1–8.

[3012] VGAM106 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus. VGAM106 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[3013] VGAM106 gene encodes a VGAM106 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM106 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide se–

quence of VGAM106 precursor RNA is designated SEQ ID:92, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:92 is located at position 43627 relative to the genome of Vaccinia Virus.

[3014] VGAM106 precursor RNA folds onto itself, forming VGAM106 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[3015] An enzyme complex designated DICER COMPLEX, `dices` the VGAM106 folded precursor RNA into VGAM106 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of VGAM106 RNA is designated SEQ ID:441, and is

provided hereinbelow with reference to the sequence listing part.

[3016] VGAM106 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM106 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM106 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[3017] VGAM106 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM106 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM106 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limit-

ing – VGAM106 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM106 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[3018] The complementary binding of VGAM106 RNA, herein designated VGAM RNA, to host target binding sites on VGAM106 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM106 host target RNA into VGAM106 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[3019] It is appreciated that VGAM106 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM106 host target genes. The mRNA of each one of this plurality of VGAM106 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM106 RNA, herein designated VGAM RNA, and which when bound by VGAM106 RNA causes inhibition of translation of respective one or more VGAM106 host target proteins.

[3020] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM106 gene, herein designated VGAM GENE, on one or more VGAM106 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[3021] It is yet further appreciated that a function of VGAM106 is inhibition of expression of host target genes, as part of a

novel viral mechanism of attacking a host. Accordingly, utilities of VGAM106 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM106 correlate with, and may be deduced from, the identity of the host target genes which VGAM106 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[3022] Nucleotide sequences of the VGAM106 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM106 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM106 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM106 are further described hereinbelow with reference to Table 1.

[3023] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM106 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM106 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[3024] As mentioned hereinabove with reference to Fig. 1, a

function of VGAM106 gene, herein designated VGAM is inhibition of expression of VGAM106 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM106 correlate with, and may be deduced from, the identity of the target genes which VGAM106 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[3025] Interleukin 1 Receptor, Type I (IL1R1, Accession NM_000877) is a VGAM106 host target gene. IL1R1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by IL1R1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IL1R1 BINDING SITE, designated SEQ ID:782, to the nucleotide sequence of VGAM106 RNA, herein designated VGAM RNA, also designated SEQ ID:441.

[3026] A function of VGAM106 is therefore inhibition of Interleukin 1 Receptor, Type I (IL1R1, Accession NM_000877), a gene which is a receptor for interleukin-1 alpha (il-1a), beta (il-1b), and interleukin-1 receptor antagonist protein (il-1ra). Accordingly, utilities of VGAM106 include diagnosis, prevention and treatment of diseases and clinical con-

ditions associated with IL1R1. The function of IL1R1 has been established by previous studies. Interleukin-1, which has a role as a mediator in inflammation, actually consists of 2 separate but related proteins, IL1-alpha (OMIM Ref. No. 147720) and IL1-beta (OMIM Ref. No. 147760). Dower et al. (1986) showed that the cell surface receptors for the 2 forms of interleukin-1 are identical. Sims et al. (1989) cloned the human IL1R gene and compared it with the mouse gene. Both contain a single membrane-spanning segment, a large cytoplasmic region, and an extracellular, IL1-binding portion composed of 3 immunoglobulin-like domains. The IL1R gene expressed in human dermal fibroblasts was found to be identical to that expressed in T cells. By a combination of somatic cell hybrid analysis and chromosomal in situ hybridization, Copeland et al. (1991) mapped the IL1R gene to human chromosome 2q12. By RFLP analysis in interspecific backcrosses, Copeland et al. (1991) mapped the corresponding mouse gene at the centromeric end of chromosome 1, a region homologous to a portion of human chromosome 2

[3027] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

- [3028] Dower, S. K.; Kronheim, S. R.; Hopp, T. P.; Cantrell, M.; Deeley, M.; Gillis, S.; Henney, C. S.; Urdal, D. L. : The cell surface receptors for interleukin-1(alpha) and interleukin-1(beta) are identical. *Nature* 324: 266-268, 1986. ; and
- [3029] Sims, J. E.; Acres, R. B.; Grubin, C. E.; McMahan, C. J.; Wignall, J. M.; March, C. J.; Dower, S. K. : Cloning the interleukin 1 receptor from human T cells. *Proc. Nat. Acad. Sci.* 86: 89.
- [3030] Further studies establishing the function and utilities of IL1R1 are found in John Hopkins OMIM database record ID 147810, and in cited publications numbered 691-694 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Suppressor of Fused Homolog (*Drosophila*) (SUFU, Accession NM_016169) is another VGAM106 host target gene. SUFU BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SUFU, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SUFU BINDING SITE, designated SEQ ID:1668, to the nucleotide sequence of VGAM106 RNA, herein designated VGAM RNA, also designated SEQ ID:441.

[3031] Another function of VGAM106 is therefore inhibition of Suppressor of Fused Homolog (Drosophila) (SUFU, Accession NM_016169). Accordingly, utilities of VGAM106 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SUFU. CGRP-RCP (Accession NM_014478) is another VGAM106 host target gene. CGRP-RCP BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by CGRP-RCP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CGRP-RCP BINDING SITE, designated SEQ ID:1503, to the nucleotide sequence of VGAM106 RNA, herein designated VGAM RNA, also designated SEQ ID:441.

[3032] Another function of VGAM106 is therefore inhibition of CGRP-RCP (Accession NM_014478). Accordingly, utilities of VGAM106 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CGRP-RCP. LOC152348 (Accession XM_098204) is another VGAM106 host target gene. LOC152348 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC152348, corresponding

to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152348 BINDING SITE, designated SEQ ID:3358, to the nucleotide sequence of VGAM106 RNA, herein designated VGAM RNA, also designated SEQ ID:441.

[3033] Another function of VGAM106 is therefore inhibition of LOC152348 (Accession XM_098204). Accordingly, utilities of VGAM106 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152348. LOC158219 (Accession XM_088514) is another VGAM106 host target gene. LOC158219 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC158219, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158219 BINDING SITE, designated SEQ ID:3214, to the nucleotide sequence of VGAM106 RNA, herein designated VGAM RNA, also designated SEQ ID:441.

[3034] Another function of VGAM106 is therefore inhibition of LOC158219 (Accession XM_088514). Accordingly, utilities of VGAM106 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LOC158219. LOC255177 (Accession XM_172941) is another VGAM106 host target gene. LOC255177 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC255177, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255177 BINDING SITE, designated SEQ ID:3711, to the nucleotide sequence of VGAM106 RNA, herein designated VGAM RNA, also designated SEQ ID:441.

[3035] Another function of VGAM106 is therefore inhibition of LOC255177 (Accession XM_172941). Accordingly, utilities of VGAM106 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255177. LOC90522 (Accession XM_032285) is another VGAM106 host target gene. LOC90522 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC90522, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90522 BINDING SITE, designated SEQ ID:2651, to the

nucleotide sequence of VGAM106 RNA, herein designated VGAM RNA, also designated SEQ ID:441.

[3036] Another function of VGAM106 is therefore inhibition of LOC90522 (Accession XM_032285). Accordingly, utilities of VGAM106 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90522. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 107 (VGAM107) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[3037] VGAM107 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM107 was detected is described hereinabove with reference to Figs. 1–8.

[3038] VGAM107 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus. VGAM107 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[3039] VGAM107 gene encodes a VGAM107 precursor RNA,

herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM107 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM107 precursor RNA is designated SEQ ID:93, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:93 is located at position 44848 relative to the genome of Vaccinia Virus.

[3040] VGAM107 precursor RNA folds onto itself, forming VGAM107 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[3041] An enzyme complex designated DICER COMPLEX, `dices` the VGAM107 folded precursor RNA into VGAM107 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 73%) nucleotide sequence of VGAM107 RNA is designated SEQ ID:442, and is provided hereinbelow with reference to the sequence listing part.

[3042] VGAM107 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM107 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM107 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[3043] VGAM107 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM107 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM107 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding

sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM107 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM107 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[3044] The complementary binding of VGAM107 RNA, herein designated VGAM RNA, to host target binding sites on VGAM107 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM107 host target RNA into VGAM107 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[3045] It is appreciated that VGAM107 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM107 host target genes. The mRNA of each one of this plurality of VGAM107 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM107 RNA, herein designated VGAM RNA, and which when bound by VGAM107 RNA causes inhibition of translation of respective one or more VGAM107 host target proteins.

[3046] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM107 gene, herein designated VGAM GENE, on one or more VGAM107 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

`Perspective: Glimpses of a tiny RNA world`, Science
294,779 (2001)).

[3047] It is yet further appreciated that a function of VGAM107 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM107 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM107 correlate with, and may be deduced from, the identity of the host target genes which VGAM107 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[3048] Nucleotide sequences of the VGAM107 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM107 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM107 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM107 are further described hereinbelow with reference to Table 1.

[3049] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM107 host target RNA, and schematic representation of the complementarity of each of these

host target binding sites to VGAM107 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[3050] As mentioned hereinabove with reference to Fig. 1, a function of VGAM107 gene, herein designated VGAM is inhibition of expression of VGAM107 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM107 correlate with, and may be deduced from, the identity of the target genes which VGAM107 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[3051] Carcinoembryonic Antigen-related Cell Adhesion Molecule 4 (CEACAM4, Accession NM_001817) is a VGAM107 host target gene. CEACAM4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CEACAM4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CEACAM4 BINDING SITE, designated SEQ ID:860, to the nucleotide sequence of VGAM107 RNA, herein designated VGAM RNA, also designated SEQ ID:442.

[3052] A function of VGAM107 is therefore inhibition of Carci-

noembryonic Antigen-related Cell Adhesion Molecule 4 (CEACAM4, Accession NM_001817). Accordingly, utilities of VGAM107 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CEACAM4. MGC11115 (Accession NM_032310) is another VGAM107 host target gene. MGC11115 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC11115, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC11115 BINDING SITE, designated SEQ ID:2244, to the nucleotide sequence of VGAM107 RNA, herein designated VGAM RNA, also designated SEQ ID:442.

[3053] Another function of VGAM107 is therefore inhibition of MGC11115 (Accession NM_032310). Accordingly, utilities of VGAM107 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC11115. PRO2714 (Accession NM_018534) is another VGAM107 host target gene. PRO2714 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PRO2714, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO2714 BINDING SITE, designated SEQ ID:1837, to the nucleotide sequence of VGAM107 RNA, herein designated VGAM RNA, also designated SEQ ID:442.

[3054] Another function of VGAM107 is therefore inhibition of PRO2714 (Accession NM_018534). Accordingly, utilities of VGAM107 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO2714. LOC147057 (Accession XM_097166) is another VGAM107 host target gene. LOC147057 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC147057, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147057 BINDING SITE, designated SEQ ID:3288, to the nucleotide sequence of VGAM107 RNA, herein designated VGAM RNA, also designated SEQ ID:442.

[3055] Another function of VGAM107 is therefore inhibition of LOC147057 (Accession XM_097166). Accordingly, utilities of VGAM107 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC147057. LOC147976 (Accession XM_085980) is another VGAM107 host target gene. LOC147976 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC147976, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147976 BINDING SITE, designated SEQ ID:3114, to the nucleotide sequence of VGAM107 RNA, herein designated VGAM RNA, also designated SEQ ID:442.

[3056] Another function of VGAM107 is therefore inhibition of LOC147976 (Accession XM_085980). Accordingly, utilities of VGAM107 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147976. LOC57100 (Accession NM_020372) is another VGAM107 host target gene. LOC57100 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC57100, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC57100 BINDING SITE, designated SEQ ID:1917, to the nucleotide sequence of VGAM107 RNA, herein designated

VGAM RNA, also designated SEQ ID:442.

[3057] Another function of VGAM107 is therefore inhibition of LOC57100 (Accession NM_020372). Accordingly, utilities of VGAM107 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC57100. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 108 (VGAM108) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[3058] VGAM108 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM108 was detected is described hereinabove with reference to Figs. 1–8.

[3059] VGAM108 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM108 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[3060] VGAM108 gene encodes a VGAM108 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, VGAM108 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM108 precursor RNA is designated SEQ ID:94, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:94 is located at position 43844 relative to the genome of Vaccinia Virus.

[3061] VGAM108 precursor RNA folds onto itself, forming VGAM108 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[3062] An enzyme complex designated DICER COMPLEX, `dices` the VGAM108 folded precursor RNA into VGAM108 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 90%) nucleotide sequence of VGAM108 RNA is designated SEQ ID:443, and is provided hereinbelow with reference to the sequence listing part.

[3063] VGAM108 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM108 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM108 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[3064] VGAM108 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM108 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM108 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and

BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM108 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM108 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[3065] The complementary binding of VGAM108 RNA, herein designated VGAM RNA, to host target binding sites on VGAM108 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM108 host target RNA into VGAM108 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[3066] It is appreciated that VGAM108 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM108 host target genes. The mRNA of

each one of this plurality of VGAM108 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM108 RNA, herein designated VGAM RNA, and which when bound by VGAM108 RNA causes inhibition of translation of respective one or more VGAM108 host target proteins.

[3067] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM108 gene, herein designated VGAM GENE, on one or more VGAM108 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science

294,779 (2001)).

[3068] It is yet further appreciated that a function of VGAM108 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM108 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM108 correlate with, and may be deduced from, the identity of the host target genes which VGAM108 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[3069] Nucleotide sequences of the VGAM108 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM108 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM108 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM108 are further described hereinbelow with reference to Table 1.

[3070] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM108 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM108 RNA, herein desig-

nated VGAM RNA, are described hereinbelow with reference to Table 2.

[3071] As mentioned hereinabove with reference to Fig. 1, a function of VGAM108 gene, herein designated VGAM is inhibition of expression of VGAM108 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM108 correlate with, and may be deduced from, the identity of the target genes which VGAM108 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[3072] E2F Transcription Factor 3 (E2F3, Accession NM_001949) is a VGAM108 host target gene. E2F3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by E2F3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of E2F3 BINDING SITE, designated SEQ ID:875, to the nucleotide sequence of VGAM108 RNA, herein designated VGAM RNA, also designated SEQ ID:443.

[3073] A function of VGAM108 is therefore inhibition of E2F Transcription Factor 3 (E2F3, Accession NM_001949), a gene which binds dna and controls cell-cycle progression from g1 to s phase. Accordingly, utilities of VGAM108 include diagnosis, prevention and treatment of diseases and clinical conditions associated with E2F3. The function of E2F3 has been established by previous studies. MYC (OMIM Ref. No. 190080) induces transcription of the E2F1, E2F2 (OMIM Ref. No. 600426), and E2F3 genes. Using primary mouse embryo fibroblasts deleted for individual E2f genes, Leone et al. (2001) showed that MYC-induced S phase and apoptosis requires distinct E2F activities. The ability of Myc to induce S phase was impaired in the absence of either E2f2 or E2f3 but not E2f1 or E2f4 (OMIM Ref. No. 600659). In contrast, the ability of Myc to induce apoptosis was markedly reduced in cells deleted for E2f1 but not E2f2 or E2f3. The authors proposed that the induction of specific E2F activities is an essential component in the MYC pathways that control cell proliferation and cell fate decisions. Animal model experiments lend further support to the function of E2F3. Cloud et al. (2002) generated E2f3-null mice. They found that E2f3 was essential for embryonic viability in the pure 129/Sv background,

but that the presence of C57BL/6 alleles yielded some adult survivors. Although growth retarded, surviving E2f3^{-/-} animals were initially healthy and exhibited no obvious tumor phenotype. They died prematurely, however, with signs typical of congestive heart failure, a defect completely distinct from those reported in E2f1-null mice. Cloud et al. (2002) also generated E2f1/E2f3 compound mutant mice and found that almost all of the developmental and age-related defects arising in the individual E2f1- or E2f3-null mice were exacerbated by the mutation of the other E2f. One major difference in the properties of E2f1 and E2f3 loss was that, either alone or in combination with loss of E2f1, E2f3 mutants did not show an increase in the incidence of tumor formation.

[3074] It is appreciated that the abovementioned animal model for E2F3 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[3075] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[3076] Leone, G.; Sears, R.; Huang, E.; Rempel, R.; Nuckolls, F.; Park, C.-H.; Giangrande, P.; Wu, L.; Saavedra, H. I.; Field,

S. J.; Thompson, M. A.; Yang, H.; Fujiwara, Y.; Greenberg, M. E.; Orkin, S.; Smith, C.; Nevins, J. R. : Myc requires distinct E2F activities to induce S phase and apoptosis.

Molec. Cell 8: 105–113, 2001. ; and

[3077] Cloud, J. E.; Rogers, C.; Reza, T. L.; Ziebold, U.; Stone, J. R.; Picard, M. H.; Caron, A. M.; Bronson, R. T.; Lees, J. A. : Mutant mouse models reveal the relative roles of E2F1 and E2.

[3078] Further studies establishing the function and utilities of E2F3 are found in John Hopkins OMIM database record ID 600427, and in cited publications numbered 1714–1715, 171 and 2170 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Sex Comb On Midleg-like 1 (Drosophila) (SCML1, Accession NM_006746) is another VGAM108 host target gene. SCML1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SCML1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SCML1 BINDING SITE, designated SEQ ID:1328, to the nucleotide sequence of VGAM108 RNA, herein designated VGAM RNA, also designated SEQ

ID:443.

[3079] Another function of VGAM108 is therefore inhibition of Sex Comb On Midleg-like 1 (*Drosophila*) (SCML1, Accession NM_006746). Accordingly, utilities of VGAM108 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SCML1. KIAA1468 (Accession XM_166289) is another VGAM108 host target gene. KIAA1468 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1468, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1468 BINDING SITE, designated SEQ ID:3541, to the nucleotide sequence of VGAM108 RNA, herein designated VGAM RNA, also designated SEQ ID:443.

[3080] Another function of VGAM108 is therefore inhibition of KIAA1468 (Accession XM_166289). Accordingly, utilities of VGAM108 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1468. MGC16025 (Accession NM_032923) is another VGAM108 host target gene. MGC16025 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by MGC16025, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC16025 BINDING SITE, designated SEQ ID:2295, to the nucleotide sequence of VGAM108 RNA, herein designated VGAM RNA, also designated SEQ ID:443.

[3081] Another function of VGAM108 is therefore inhibition of MGC16025 (Accession NM_032923). Accordingly, utilities of VGAM108 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC16025. LOC148545 (Accession XM_086226) is another VGAM108 host target gene. LOC148545 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC148545, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148545 BINDING SITE, designated SEQ ID:3119, to the nucleotide sequence of VGAM108 RNA, herein designated VGAM RNA, also designated SEQ ID:443.

[3082] Another function of VGAM108 is therefore inhibition of LOC148545 (Accession XM_086226). Accordingly, utilities

of VGAM108 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148545. LOC163669 (Accession XM_089054) is another VGAM108 host target gene. LOC163669 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC163669, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC163669 BINDING SITE, designated SEQ ID:3233, to the nucleotide sequence of VGAM108 RNA, herein designated VGAM RNA, also designated SEQ ID:443.

[3083] Another function of VGAM108 is therefore inhibition of LOC163669 (Accession XM_089054). Accordingly, utilities of VGAM108 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC163669. LOC51652 (Accession NM_016079) is another VGAM108 host target gene. LOC51652 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC51652, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

LOC51652 BINDING SITE, designated SEQ ID:1660, to the nucleotide sequence of VGAM108 RNA, herein designated VGAM RNA, also designated SEQ ID:443.

[3084] Another function of VGAM108 is therefore inhibition of LOC51652 (Accession NM_016079). Accordingly, utilities of VGAM108 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51652. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 109 (VGAM109) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[3085] VGAM109 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM109 was detected is described hereinabove with reference to Figs. 1–8.

[3086] VGAM109 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus. VGAM109 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[3087] VGAM109 gene encodes a VGAM109 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM109 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM109 precursor RNA is designated SEQ ID:95, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:95 is located at position 46236 relative to the genome of Vaccinia Virus.

[3088] VGAM109 precursor RNA folds onto itself, forming VGAM109 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[3089] An enzyme complex designated DICER COMPLEX, `dices` the VGAM109 folded precursor RNA into VGAM109 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of VGAM109 RNA is designated SEQ ID:444, and is provided hereinbelow with reference to the sequence listing part.

[3090] VGAM109 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM109 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM109 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[3091] VGAM109 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM109 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM109 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an il-

illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM109 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM109 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[3092] The complementary binding of VGAM109 RNA, herein designated VGAM RNA, to host target binding sites on VGAM109 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM109 host target RNA into VGAM109 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[3093] It is appreciated that VGAM109 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM109 host target genes. The mRNA of each one of this plurality of VGAM109 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM109 RNA, herein designated VGAM RNA, and which when bound by VGAM109 RNA causes inhibition of translation of respective one or more VGAM109 host target proteins.

[3094] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM109 gene, herein designated VGAM GENE, on one or more VGAM109 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G.,
`Perspective: Glimpses of a tiny RNA world`, Science
294,779 (2001)).

[3095] It is yet further appreciated that a function of VGAM109 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM109 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM109 correlate with, and may be deduced from, the identity of the host target genes which VGAM109 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[3096] Nucleotide sequences of the VGAM109 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM109 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM109 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM109 are further described hereinbelow with reference to Table 1.

[3097] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM109 host target RNA, and schematic

representation of the complementarity of each of these host target binding sites to VGAM109 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[3098] As mentioned hereinabove with reference to Fig. 1, a function of VGAM109 gene, herein designated VGAM is inhibition of expression of VGAM109 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM109 correlate with, and may be deduced from, the identity of the target genes which VGAM109 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[3099] Chemokine (C-X-C motif) Ligand 13 (B-cell chemoattractant) (CXCL13, Accession NM_006419) is a VGAM109 host target gene. CXCL13 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CXCL13, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CXCL13 BINDING SITE, designated SEQ ID:1299, to the nucleotide sequence of VGAM109 RNA, herein designated VGAM RNA, also designated SEQ ID:444.

[3100] A function of VGAM109 is therefore inhibition of Chemokine (C-X-C motif) Ligand 13 (B-cell chemoattractant) (CXCL13, Accession NM_006419), a gene which plays a role in directing the migration of b lymphocytes to follicles . Accordingly, utilities of VGAM109 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CXCL13. The function of CXCL13 has been established by previous studies. Burkitt lymphoma receptor-1 (BLR1; 601613), also called CXCR5, is highly expressed on Burkitt lymphoma cells and B lymphocytes. To identify the ligand of BLR1, Legler et al. (1998) searched an EST database for CXC chemokine motifs and, by PCR analysis using spleen cDNA, cloned a cDNA encoding BCA1 (B cell-attracting chemokine-1). Sequence analysis predicted that the 109-amino acid BCA1 protein contains a 22-amino acid signal sequence and an arginine residue immediately preceding the first of 4 cysteine residues, a feature typical of CXC chemokines. Northern and RNA dot blot analysis detected constitutive expression of a 1.4-kb BCA1 transcript, with highest expression in liver, followed by spleen, lymph nodes, appendix, and stomach; lower expression was detected in salivary and mammary glands, and no expression was detected in any

other tissues. B lymphocytes recirculate between B cell-rich compartments (follicles or B zones) in secondary lymphoid organs, surveying for antigen. After antigen binding, B cells move to the boundary of B and T zones to interact with T-helper cells. Reif et al. (2002) demonstrated that antigen-engaged B cells have increased expression of CCR7 (OMIM Ref. No. 600242), the receptor for the T-zone chemokines CCL19 (OMIM Ref. No. 602227) and CCL21 (OMIM Ref. No. 602737), and that they exhibit increased responsiveness to both chemoattractants. In mice lacking lymphoid CCL19 and CCL21 chemokines, or with B cells that lack CCR7, antigen engagement fails to cause movement to the T zone. Using retroviral-mediated gene transfer, the authors demonstrated that increased expression of CCR7 is sufficient to direct B cells to the T zone. Reciprocally, overexpression of CXCR5, the receptor for the B-zone chemokine CXCL13, is sufficient to overcome antigen-induced B-cell movement to the T zone. Reif et al. (2002) concluded that their findings defined the mechanism of B-cell relocalization in response to antigen, and established that cell position in vivo can be determined by the balance of responsiveness to chemoattractants made in separate but adjacent zones. Animal model experi-

ments lend further support to the function of CXCL13. CXC chemokine receptor-5 (CXCR5), the receptor for BLC, was known to be required for B-cell migration to splenic follicles, but the requirements for homing to B-cell areas and lymph nodes remained to be defined. Ansel et al. (2000) demonstrated that lymph nodes contain 2 types of B cell-rich compartment: follicles containing follicular dendritic cells, and areas lacking such cells. Ansel et al. (2000) generated mice deficient in BLC by targeted disruption. These mice had severe but incompletely penetrant defects in development of peripheral lymphoid organs. Most mice lacked inguinal, iliac, sacral, brachial, and axillary lymph nodes, among others. However, most of these lymph nodes were found at varying low frequencies, and several other lymph nodes developed normally, with all animals possessing a full set of mesenteric lymph nodes. BLC-deficient mice were similar in appearance to mice deficient in CXCR5. However, CXCR5-deficient mice have less severe deficiency in Peyer patches. Using these BLC-deficient mice, Ansel et al. (2000) established that BLC and CXCR5 are needed for B-cell homing to follicles in lymph nodes as well as in spleen. They also found that BLC is required for the development of most lymph nodes

and Peyer patches. In addition to mediating chemoattraction, BLC induces B cells to upregulate membrane lymphotoxin alpha-1-beta-2 (see OMIM Ref. No. 600978), a cytokine that promotes follicular dendritic cell development and BLC expression, establishing a positive feedback loop thought to be important in follicle development and homeostasis. In germinal centers, the feedback loop is overridden, with B cell lymphotoxin alpha-1-beta-2 expression being induced by a mechanism independent of BLC.

[3101] It is appreciated that the abovementioned animal model for CXCL13 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[3102] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[3103] Ansel, K. M.; Harris, R. B. S.; Cyster, J. G. : CXCL13 is required for B1 cell homing, natural antibody production, and body cavity immunity. *Immunity* 16: 67-76, 2002. ; and

[3104] Gunn, M. D.; Ngo, V. N.; Ansel, K. M.; Ekland, E. H.; Cyster, J. G.; Williams, L. T. : A B-cell-homing chemokine made in

lymphoid follicles activates Burkitt's lymphoma receptor-1. Natsu.

[3105] Further studies establishing the function and utilities of CXCL13 are found in John Hopkins OMIM database record ID 605149, and in cited publications numbered 1651, 2053-165 and 1796 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. RAS Guanyl Releasing Protein 1 (calcium and DAG-regulated) (RASGRP1, Accession NM_005739) is another VGAM109 host target gene. RASGRP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RASGRP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RASGRP1 BINDING SITE, designated SEQ ID:1241, to the nucleotide sequence of VGAM109 RNA, herein designated VGAM RNA, also designated SEQ ID:444.

[3106] Another function of VGAM109 is therefore inhibition of RAS Guanyl Releasing Protein 1 (calcium and DAG-regulated) (RASGRP1, Accession NM_005739). Accordingly, utilities of VGAM109 include diagnosis, prevention and treatment of diseases and clinical conditions associ-

ated with RASGRP1. HTGN29 (Accession NM_020199) is another VGAM109 host target gene. HTGN29 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HTGN29, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HTGN29 BINDING SITE, designated SEQ ID:1899, to the nucleotide sequence of VGAM109 RNA, herein designated VGAM RNA, also designated SEQ ID:444.

[3107] Another function of VGAM109 is therefore inhibition of HTGN29 (Accession NM_020199). Accordingly, utilities of VGAM109 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HTGN29. KIAA1430 (Accession XM_087593) is another VGAM109 host target gene. KIAA1430 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1430, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1430 BINDING SITE, designated SEQ ID:3179, to the nucleotide sequence of VGAM109 RNA, herein designated VGAM RNA, also desig-

nated SEQ ID:444.

[3108] Another function of VGAM109 is therefore inhibition of KIAA1430 (Accession XM_087593). Accordingly, utilities of VGAM109 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1430. KIAA1764 (Accession XM_045086) is another VGAM109 host target gene. KIAA1764 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA1764, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1764 BINDING SITE, designated SEQ ID:2850, to the nucleotide sequence of VGAM109 RNA, herein designated VGAM RNA, also designated SEQ ID:444.

[3109] Another function of VGAM109 is therefore inhibition of KIAA1764 (Accession XM_045086). Accordingly, utilities of VGAM109 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1764. ZAK (Accession NM_133646) is another VGAM109 host target gene. ZAK BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ZAK, corresponding to a HOST TAR-

GET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZAK BINDING SITE, designated SEQ ID:2428, to the nucleotide sequence of VGAM109 RNA, herein designated VGAM RNA, also designated SEQ ID:444.

[3110] Another function of VGAM109 is therefore inhibition of ZAK (Accession NM_133646). Accordingly, utilities of VGAM109 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZAK. LOC151571 (Accession XM_098088) is another VGAM109 host target gene. LOC151571 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC151571, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151571 BINDING SITE, designated SEQ ID:3348, to the nucleotide sequence of VGAM109 RNA, herein designated VGAM RNA, also designated SEQ ID:444.

[3111] Another function of VGAM109 is therefore inhibition of LOC151571 (Accession XM_098088). Accordingly, utilities of VGAM109 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LOC151571. LOC196989 (Accession XM_116969) is another VGAM109 host target gene. LOC196989 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC196989, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC196989 BINDING SITE, designated SEQ ID:3470, to the nucleotide sequence of VGAM109 RNA, herein designated VGAM RNA, also designated SEQ ID:444.

[3112] Another function of VGAM109 is therefore inhibition of LOC196989 (Accession XM_116969). Accordingly, utilities of VGAM109 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196989. LOC221431 (Accession XM_166380) is another VGAM109 host target gene. LOC221431 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221431, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221431 BINDING SITE, designated SEQ ID:3553, to

the nucleotide sequence of VGAM109 RNA, herein designated VGAM RNA, also designated SEQ ID:444.

[3113] Another function of VGAM109 is therefore inhibition of LOC221431 (Accession XM_166380). Accordingly, utilities of VGAM109 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221431. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 110 (VGAM110) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[3114] VGAM110 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM110 was detected is described hereinabove with reference to Figs. 1–8.

[3115] VGAM110 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM110 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[3116] VGAM110 gene encodes a VGAM110 precursor RNA,

herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM110 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM110 precursor RNA is designated SEQ ID:96, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:96 is located at position 51758 relative to the genome of Vaccinia Virus.

[3117] VGAM110 precursor RNA folds onto itself, forming VGAM110 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[3118] An enzyme complex designated DICER COMPLEX, `dices` the VGAM110 folded precursor RNA into VGAM110 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of VGAM110 RNA is designated SEQ ID:445, and is provided hereinbelow with reference to the sequence listing part.

[3119] VGAM110 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM110 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM110 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[3120] VGAM110 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM110 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM110 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding

sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM110 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM110 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[3121] The complementary binding of VGAM110 RNA, herein designated VGAM RNA, to host target binding sites on VGAM110 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM110 host target RNA into VGAM110 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[3122] It is appreciated that VGAM110 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM110 host target genes. The mRNA of each one of this plurality of VGAM110 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM110 RNA, herein designated VGAM RNA, and which when bound by VGAM110 RNA causes inhibition of translation of respective one or more VGAM110 host target proteins.

[3123] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM110 gene, herein designated VGAM GENE, on one or more VGAM110 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

`Perspective: Glimpses of a tiny RNA world`, Science
294,779 (2001)).

[3124] It is yet further appreciated that a function of VGAM110 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM110 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM110 correlate with, and may be deduced from, the identity of the host target genes which VGAM110 binds and inhibits, and the function of these host target genes, as elaborated herein–below.

[3125] Nucleotide sequences of the VGAM110 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM110 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM110 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM110 are further described hereinbelow with reference to Table 1.

[3126] Nucleotide sequences of host target binding sites, such as BINDING SITE–I, BINDING SITE–II and BINDING SITE–III of Fig. 1, found on VGAM110 host target RNA, and schematic representation of the complementarity of each of these

host target binding sites to VGAM110 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[3127] As mentioned hereinabove with reference to Fig. 1, a function of VGAM110 gene, herein designated VGAM is inhibition of expression of VGAM110 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM110 correlate with, and may be deduced from, the identity of the target genes which VGAM110 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[3128] Collagen, Type XII, Alpha 1 (COL12A1, Accession NM_004370) is a VGAM110 host target gene. COL12A1 BINDING SITE1 and COL12A1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by COL12A1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of COL12A1 BINDING SITE1 and COL12A1 BINDING SITE2, designated SEQ ID:1102 and SEQ ID:2380 respectively, to the nucleotide sequence of VGAM110 RNA, herein designated VGAM RNA, also designated SEQ ID:445.

[3129] A function of VGAM110 is therefore inhibition of Collagen, Type XII, Alpha 1 (COL12A1, Accession NM_004370). Accordingly, utilities of VGAM110 include diagnosis, prevention and treatment of diseases and clinical conditions associated with COL12A1. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 111 (VGAM111) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[3130] VGAM111 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM111 was detected is described hereinabove with reference to Figs. 1–8.

[3131] VGAM111 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM111 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[3132] VGAM111 gene encodes a VGAM111 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM111

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM111 precursor RNA is designated SEQ ID:97, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:97 is located at position 51252 relative to the genome of Vaccinia Virus.

[3133] VGAM111 precursor RNA folds onto itself, forming VGAM111 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[3134] An enzyme complex designated DICER COMPLEX, `dices` the VGAM111 folded precursor RNA into VGAM111 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 25%) nucleotide sequence of VGAM111 RNA is designated SEQ ID:446, and is provided hereinbelow with reference to the sequence listing part.

[3135] VGAM111 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM111 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM111 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[3136] VGAM111 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM111 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM111 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the

number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM111 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM111 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[3137] The complementary binding of VGAM111 RNA, herein designated VGAM RNA, to host target binding sites on VGAM111 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM111 host target RNA into VGAM111 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[3138] It is appreciated that VGAM111 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM111 host target genes. The mRNA of each one of this plurality of VGAM111 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM111 RNA, herein designated VGAM RNA, and which when bound by VGAM111 RNA causes inhibition of translation of respective one or more VGAM111 host target proteins.

[3139] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM111 gene, herein designated VGAM GENE, on one or more VGAM111 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[3140] It is yet further appreciated that a function of VGAM111 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM111 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM111 correlate with, and may be deduced from, the identity of the host target genes which VGAM111 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[3141] Nucleotide sequences of the VGAM111 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM111 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM111 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM111 are further described hereinbelow with reference to Table 1.

[3142] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM111 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM111 RNA, herein designated VGAM RNA, are described hereinbelow with refer-

ence to Table 2.

[3143] As mentioned hereinabove with reference to Fig. 1, a function of VGAM111 gene, herein designated VGAM is inhibition of expression of VGAM111 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM111 correlate with, and may be deduced from, the identity of the target genes which VGAM111 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[3144] Ankyrin 1, Erythrocytic (ANK1, Accession NM_000037) is a VGAM111 host target gene. ANK1 BINDING SITE1 and ANK1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by ANK1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ANK1 BINDING SITE1 and ANK1 BINDING SITE2, designated SEQ ID:699 and SEQ ID:1918 respectively, to the nucleotide sequence of VGAM111 RNA, herein designated VGAM RNA, also designated SEQ ID:446.

[3145] A function of VGAM111 is therefore inhibition of Ankyrin 1, Erythrocytic (ANK1, Accession NM_000037). Accordingly, utilities of VGAM111 include diagnosis, prevention

and treatment of diseases and clinical conditions associated with ANK1. Desmoplakin (DPI, DPII) (DSP, Accession NM_004415) is another VGAM111 host target gene. DSP BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DSP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DSP BINDING SITE, designated SEQ ID:1110, to the nucleotide sequence of VGAM111 RNA, herein designated VGAM RNA, also designated SEQ ID:446.

[3146] Another function of VGAM111 is therefore inhibition of Desmoplakin (DPI, DPII) (DSP, Accession NM_004415). Accordingly, utilities of VGAM111 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DSP. Growth Differentiation Factor 5 (cartilage-derived morphogenetic protein-1) (GDF5, Accession NM_000557) is another VGAM111 host target gene. GDF5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GDF5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide se-

quences of GDF5 BINDING SITE, designated SEQ ID:755, to the nucleotide sequence of VGAM111 RNA, herein designated VGAM RNA, also designated SEQ ID:446.

[3147] Another function of VGAM111 is therefore inhibition of Growth Differentiation Factor 5 (cartilage-derived morphogenetic protein-1) (GDF5, Accession NM_000557), a gene which could be involved in bone formation. Accordingly, utilities of VGAM111 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GDF5. The function of GDF5 has been established by previous studies. Thomas et al. (1997) showed that a cys400-to-tyr mutation (C400Y; 601146.0003) in the CDMP1 gene resulted in Grebe type chondrodysplasia (OMIM Ref. No. 200700). They found that the mutant protein is not secreted and is inactive in vitro. It produced a dominant-negative effect by preventing the secretion of other, related bone morphogenetic proteins (BMPs). This appeared to occur through the formation of heterodimers. The mutation and its proposed mechanism of action provided the first human genetic indication that composite expression patterns of different BMPs dictate limb and digit morphogenesis. The role of a dominant-negative mutation in a recessive disorder was illustrated. Animal

model experiments lend further support to the function of GDF5. Tsumaki et al. (1999) generated transgenic mice expressing recombinant CDMP1. These mice died before or just after birth and exhibited chondrodysplasia with expanded primordial cartilage, which consisted of an enlarged hypertrophic zone and a reduced proliferating chondrocyte zone, not only in the limbs but also in the axial skeleton. Histologically, CDMP1 increased the number of chondroprogenitor cells and accelerated chondrocyte differentiation to hypertrophy. Moreover, ectopic expression of CDMP1 in the notochord before onset of chondrogenesis inhibited mesenchymal cell condensation around the notochord, which led to failure of vertebral body formation.

[3148] It is appreciated that the abovementioned animal model for GDF5 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[3149] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[3150] Thomas, J. T.; Kilpatrick, M. W.; Lin, K.; Erlacher, L.; Lembessis, P.; Costa, T.; Tsipouras, P.; Luyten, F. P. : Disrup-

tion of human limb morphogenesis by a dominant negative mutation in CDMP1. Nature Genet. 58–64, 1997. ; and

[3151] Tsumaki, N.; Tanaka, K.; Arikawa–Hirasawa, E.; Nakase, T.; Kimura, T.; Thomas, J. T.; Ochi, T.; Luyten, F. P.; Yamada, Y. : Role of CDMP–1 in skeletal morphogenesis: promotion of mesenc.

[3152] Further studies establishing the function and utilities of GDF5 are found in John Hopkins OMIM database record ID 601146, and in cited publications numbered 2080, 2083, 2134–1106, 2283, 1700, 1107–1108, 1701, 1702, 271 and 2791 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Oxoglutarate (alpha–ketoglutarate) Dehydrogenase (lipoamide) (OGDH, Accession XM_165877) is another VGAM111 host target gene. OGDH BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by OGDH, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OGDH BINDING SITE, designated SEQ ID:3510, to the nucleotide sequence of VGAM111 RNA, herein designated VGAM RNA, also designated SEQ ID:446.

[3153] Another function of VGAM111 is therefore inhibition of Oxoglutarate (alpha-ketoglutarate) Dehydrogenase (lipoamide) (OGDH, Accession XM_165877), a gene which helps convert a-ketoglutarate to succinyl coenzyme A in Krebs cycle. Accordingly, utilities of VGAM111 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OGDH. The function of OGDH has been established by previous studies. In 3 males born to first-cousin Algerian parents and presenting with hypotonia, metabolic acidosis, and hyperlactatemia immediately after birth, Bonnefont et al. (1992) described a 'new' inborn error of the tricarboxylic acid cycle, alpha-ketoglutarate dehydrogenase deficiency. Neurologic deterioration resulted in death at about 30 months of age. Low molar ratios of ketone bodies in plasma of neonates with congenital lactic acidosis were proposed as an indicator of dysfunction of the tricarboxylic acid cycle. The parents of the 3 sibs were related as first cousins. Kohlschutter et al. (1982) reported a case of partial alpha-ketoglutarate dehydrogenase deficiency in 2 sibs of a consanguineous Tunisian family. In addition to genetic defects of the tricarboxylic acid cycle, other mechanisms for recessively inherited congenital lactic acidosis include inborn errors

of pyruvate metabolism and inborn errors of oxidative phosphorylation. Guffon et al. (1993) described 2 new familial cases of 2-ketoglutarate dehydrogenase deficiency: a sister and brother born of consanguineous Portuguese parents. Axial hypotonia with no head control as late as age 4 years was described in both. Metabolic acidosis with acute episodes of acidotic decompensation and sometimes hypoglycemia occurred during infections. The sister died suddenly after a general anesthesia. The alpha-ketoglutarate dehydrogenase complex is a multienzyme complex consisting of 3 protein subunits, alpha-ketoglutarate dehydrogenase (E1k, or oxoglutarate dehydrogenase; OGDH; EC 1.2.4.2), dihydrolipoyl succinyltransferase (E2k, or DLST; 126063), and dihydrolipoyl dehydrogenase (E3; 246900). The complex catalyzes a key reaction in the Krebs tricarboxylic acid cycle. The DLST gene maps to 14q24.3 and the E3 gene maps to chromosome 7. Koike et al. (1992) cloned the E1k gene, which codes for the alpha-ketoglutarate dehydrogenase subunit. Using 2 human/rodent somatic cell hybrid panels, Szabo et al. (1994) mapped the OGDH gene to 7p13-p11.2. A second related sequence, possibly a pseudogene, was identified and mapped to chromosome 10. Szabo et al.

(1994) pointed to a possible significance to the finding of a reduction in the activity of this complex in Alzheimer disease brain and cultured skin fibroblasts from Alzheimer disease patients.

[3154] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[3155] Guffon, N.; Lopez-Mediavilla, C.; Dumoulin, R.; Mousson, B.; Godinot, C.; Carrier, H.; Collombet, J. M.; Divry, P.; Mathieu, M.; Guibaud, P. : 2-Ketoglutarate dehydrogenase deficiency, a rare cause of primary hyperlactataemia: report of a new case. J. Inherit. Metab. Dis. 16: 821-830, 1993. ; and

[3156] Szabo, P.; Cai, X.; Ali, G.; Blass, J. P. : Localization of the gene (OGDH) coding for the E1 α component of the alpha-ketoglutarate dehydrogenase complex to chromosome 7p13-p11.2. Genomi.

[3157] Further studies establishing the function and utilities of OGDH are found in John Hopkins OMIM database record ID 203740, and in cited publications numbered 2973-2978 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Regulatory Factor X, 2 (influences HLA class II ex-

pression) (RFX2, Accession NM_000635) is another VGAM111 host target gene. RFX2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RFX2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RFX2 BINDING SITE, designated SEQ ID:765, to the nucleotide sequence of VGAM111 RNA, herein designated VGAM RNA, also designated SEQ ID:446.

[3158] Another function of VGAM111 is therefore inhibition of Regulatory Factor X, 2 (influences HLA class II expression) (RFX2, Accession NM_000635), a gene which acts as a dimer to regulate the expression of many genes. Accordingly, utilities of VGAM111 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RFX2. The function of RFX2 has been established by previous studies. Pugliatti et al. (1992) noted that the expression of HLA class II genes (DR, DQ, and DP) is controlled primarily by cis-acting DNA motifs located within the 150 bp upstream of the genes and in particular by 2 highly conserved sequences, the X and Y boxes. Several protein factors bind to these cis-acting sequences.

RFX is of special interest since a specific defect in its binding to target DNA sequence has been observed in patients with HLA class II deficient combined immunodeficiency (see OMIM Ref. No. 209920). Overexpression of RFX in transfected cells transactivates an HLA class II promoter, and antisense RNA expressed in transfected cells inhibits the expression of HLA-DR genes. A closely related form of RFX, referred to as RFX2, has also been isolated. The RFX1 (OMIM Ref. No. 600006) gene product is a transactivator of the human hepatitis B viral enhancer I. Reith et al. (1994) commented that the RFX family members, particularly RFX1 and RFX3 (OMIM Ref. No. 601337), constitute the nuclear complexes referred to previously as enhancer factor C (EF-C), EP, and methylation-dependent DNA-binding protein (MDBP), or rpL30-alpha. Reith et al. (1994) identified and cloned 3 members of this gene family from both human and mouse using lambda gt11 cDNA libraries. The gene encoding human RFX2 encodes a 721-amino acid polypeptide. Homology between the 3 RFX proteins is restricted largely to 5 conserved regions, including the 2 domains required for DNA binding and dimerization. Reith et al. (1994) found that RFX1, RFX2, and RFX3 have similar DNA-binding specificities. The RFX

monomers can heterodimerize both in vivo and in vitro, but all 3 are capable of binding DNA as monomers. They showed that the RFX2 transcript is particularly elevated in mouse testis.

[3159] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[3160] Pugliatti, L.; Derre, J.; Berger, R.; Ucla, C.; Reith, W.; Mach, B. : The genes for MHC class II regulatory factors RFX1 and RFX2 are located on the short arm of chromosome 19. Genomics 13: 1307–1310, 1992. ; and

[3161] Reith, W.; Ucla, C.; Barras, E.; Gaud, A.; Durand, B.; Herrero-Sanchez, C.; Kobr, M.; Mach, B. : RFX1, a transactivator of hepatitis B virus enhancer I, belongs to a novel family of hom.

[3162] Further studies establishing the function and utilities of RFX2 are found in John Hopkins OMIM database record ID 142765, and in cited publications numbered 1061–1063 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. SET7 (Accession NM_030648) is another VGAM111 host target gene. SET7 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by SET7, corre-

sponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SET7 BINDING SITE, designated SEQ ID:2153, to the nucleotide sequence of VGAM111 RNA, herein designated VGAM RNA, also designated SEQ ID:446.

[3163] Another function of VGAM111 is therefore inhibition of SET7 (Accession NM_030648). Accordingly, utilities of VGAM111 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SET7. Chromosome 17 Open Reading Frame 31 (C17orf31, Accession NM_017575) is another VGAM111 host target gene. C17orf31 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C17orf31, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C17orf31 BINDING SITE, designated SEQ ID:1723, to the nucleotide sequence of VGAM111 RNA, herein designated VGAM RNA, also designated SEQ ID:446.

[3164] Another function of VGAM111 is therefore inhibition of Chromosome 17 Open Reading Frame 31 (C17orf31, Ac-

cession NM_017575). Accordingly, utilities of VGAM111 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C17orf31. caspr5 (Accession NM_130773) is another VGAM111 host target gene. caspr5 BINDING SITE1 and caspr5 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by caspr5, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of caspr5 BINDING SITE1 and caspr5 BINDING SITE2, designated SEQ ID:2396 and SEQ ID:2462 respectively, to the nucleotide sequence of VGAM111 RNA, herein designated VGAM RNA, also designated SEQ ID:446.

[3165] Another function of VGAM111 is therefore inhibition of caspr5 (Accession NM_130773). Accordingly, utilities of VGAM111 include diagnosis, prevention and treatment of diseases and clinical conditions associated with caspr5. DKFZP434P0111 (Accession XM_041116) is another VGAM111 host target gene. DKFZP434P0111 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP434P0111, corresponding to a HOST TARGET binding site such as

BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434P0111 BINDING SITE, designated SEQ ID:2790, to the nucleotide sequence of VGAM111 RNA, herein designated VGAM RNA, also designated SEQ ID:446.

[3166] Another function of VGAM111 is therefore inhibition of DKFZP434P0111 (Accession XM_041116). Accordingly, utilities of VGAM111 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434P0111. FLJ10634 (Accession NM_018163) is another VGAM111 host target gene. FLJ10634 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10634, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10634 BINDING SITE, designated SEQ ID:1791, to the nucleotide sequence of VGAM111 RNA, herein designated VGAM RNA, also designated SEQ ID:446.

[3167] Another function of VGAM111 is therefore inhibition of FLJ10634 (Accession NM_018163). Accordingly, utilities of VGAM111 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with FLJ10634. FLJ32334 (Accession NM_144565) is another VGAM111 host target gene. FLJ32334 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ32334, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ32334 BINDING SITE, designated SEQ ID:2483, to the nucleotide sequence of VGAM111 RNA, herein designated VGAM RNA, also designated SEQ ID:446.

[3168] Another function of VGAM111 is therefore inhibition of FLJ32334 (Accession NM_144565). Accordingly, utilities of VGAM111 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ32334. FLJ32894 (Accession NM_144667) is another VGAM111 host target gene. FLJ32894 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ32894, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ32894 BINDING SITE, designated SEQ ID:2491, to the nucleotide sequence of

VGAM111 RNA, herein designated VGAM RNA, also designated SEQ ID:446.

[3169] Another function of VGAM111 is therefore inhibition of FLJ32894 (Accession NM_144667). Accordingly, utilities of VGAM111 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ32894. KIAA0711 (Accession NM_014867) is another VGAM111 host target gene. KIAA0711 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA0711, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0711 BINDING SITE, designated SEQ ID:1572, to the nucleotide sequence of VGAM111 RNA, herein designated VGAM RNA, also designated SEQ ID:446.

[3170] Another function of VGAM111 is therefore inhibition of KIAA0711 (Accession NM_014867). Accordingly, utilities of VGAM111 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0711. KIAA1649 (Accession NM_032311) is another VGAM111 host target gene. KIAA1649 BINDING SITE1 and KIAA1649 BINDING SITE2 are HOST TARGET binding sites

found in untranslated regions of mRNA encoded by KIAA1649, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1649 BINDING SITE1 and KIAA1649 BINDING SITE2, designated SEQ ID:2245 and SEQ ID:2770 respectively, to the nucleotide sequence of VGAM111 RNA, herein designated VGAM RNA, also designated SEQ ID:446.

[3171] Another function of VGAM111 is therefore inhibition of KIAA1649 (Accession NM_032311). Accordingly, utilities of VGAM111 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1649. MGC4737 (Accession NM_031466) is another VGAM111 host target gene. MGC4737 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC4737, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC4737 BINDING SITE, designated SEQ ID:2206, to the nucleotide sequence of VGAM111 RNA, herein designated VGAM RNA, also designated SEQ ID:446.

[3172] Another function of VGAM111 is therefore inhibition of MGC4737 (Accession NM_031466). Accordingly, utilities of VGAM111 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC4737. LOC115110 (Accession XM_049825) is another VGAM111 host target gene. LOC115110 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC115110, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC115110 BINDING SITE, designated SEQ ID:2923, to the nucleotide sequence of VGAM111 RNA, herein designated VGAM RNA, also designated SEQ ID:446.

[3173] Another function of VGAM111 is therefore inhibition of LOC115110 (Accession XM_049825). Accordingly, utilities of VGAM111 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC115110. LOC123242 (Accession XM_063548) is another VGAM111 host target gene. LOC123242 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC123242, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC123242 BINDING SITE, designated SEQ ID:3029, to the nucleotide sequence of VGAM111 RNA, herein designated VGAM RNA, also designated SEQ ID:446.

[3174] Another function of VGAM111 is therefore inhibition of LOC123242 (Accession XM_063548). Accordingly, utilities of VGAM111 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC123242. LOC146237 (Accession XM_096954) is another VGAM111 host target gene. LOC146237 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC146237, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146237 BINDING SITE, designated SEQ ID:3282, to the nucleotide sequence of VGAM111 RNA, herein designated VGAM RNA, also designated SEQ ID:446.

[3175] Another function of VGAM111 is therefore inhibition of LOC146237 (Accession XM_096954). Accordingly, utilities of VGAM111 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC146237. LOC147160 (Accession XM_097202) is another VGAM111 host target gene. LOC147160 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC147160, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147160 BINDING SITE, designated SEQ ID:3291, to the nucleotide sequence of VGAM111 RNA, herein designated VGAM RNA, also designated SEQ ID:446.

[3176] Another function of VGAM111 is therefore inhibition of LOC147160 (Accession XM_097202). Accordingly, utilities of VGAM111 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147160. LOC149670 (Accession XM_086647) is another VGAM111 host target gene. LOC149670 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC149670, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149670 BINDING SITE, designated SEQ ID:3138, to the nucleotide sequence of VGAM111 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:446.

[3177] Another function of VGAM111 is therefore inhibition of LOC149670 (Accession XM_086647). Accordingly, utilities of VGAM111 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149670. LOC155072 (Accession XM_098661) is another VGAM111 host target gene. LOC155072 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC155072, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC155072 BINDING SITE, designated SEQ ID:3374, to the nucleotide sequence of VGAM111 RNA, herein designated VGAM RNA, also designated SEQ ID:446.

[3178] Another function of VGAM111 is therefore inhibition of LOC155072 (Accession XM_098661). Accordingly, utilities of VGAM111 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC155072. LOC158828 (Accession XM_088689) is another VGAM111 host target gene. LOC158828 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC158828, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158828 BINDING SITE, designated SEQ ID:3227, to the nucleotide sequence of VGAM111 RNA, herein designated VGAM RNA, also designated SEQ ID:446.

[3179] Another function of VGAM111 is therefore inhibition of LOC158828 (Accession XM_088689). Accordingly, utilities of VGAM111 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158828. LOC202868 (Accession XM_117477) is another VGAM111 host target gene. LOC202868 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC202868, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC202868 BINDING SITE, designated SEQ ID:3487, to the nucleotide sequence of VGAM111 RNA, herein designated VGAM RNA, also designated SEQ ID:446.

[3180] Another function of VGAM111 is therefore inhibition of LOC202868 (Accession XM_117477). Accordingly, utilities of VGAM111 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LOC202868. LOC253001 (Accession XM_171711) is another VGAM111 host target gene. LOC253001 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC253001, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253001 BINDING SITE, designated SEQ ID:3697, to the nucleotide sequence of VGAM111 RNA, herein designated VGAM RNA, also designated SEQ ID:446.

[3181] Another function of VGAM111 is therefore inhibition of LOC253001 (Accession XM_171711). Accordingly, utilities of VGAM111 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253001. LOC253841 (Accession XM_172811) is another VGAM111 host target gene. LOC253841 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC253841, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253841 BINDING SITE, designated SEQ ID:3704, to

the nucleotide sequence of VGAM111 RNA, herein designated VGAM RNA, also designated SEQ ID:446.

[3182] Another function of VGAM111 is therefore inhibition of LOC253841 (Accession XM_172811). Accordingly, utilities of VGAM111 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253841. LOC51177 (Accession NM_016274) is another VGAM111 host target gene. LOC51177 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC51177, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51177 BINDING SITE, designated SEQ ID:1676, to the nucleotide sequence of VGAM111 RNA, herein designated VGAM RNA, also designated SEQ ID:446.

[3183] Another function of VGAM111 is therefore inhibition of LOC51177 (Accession NM_016274). Accordingly, utilities of VGAM111 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51177. LOC91408 (Accession XM_038290) is another VGAM111 host target gene. LOC91408 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by LOC91408, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91408 BINDING SITE, designated SEQ ID:2735, to the nucleotide sequence of VGAM111 RNA, herein designated VGAM RNA, also designated SEQ ID:446.

[3184] Another function of VGAM111 is therefore inhibition of LOC91408 (Accession XM_038290). Accordingly, utilities of VGAM111 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91408. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 112 (VGAM112) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[3185] VGAM112 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM112 was detected is described hereinabove with reference to Figs. 1–8.

[3186] VGAM112 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Vaccinia Virus.

VGAM112 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[3187] VGAM112 gene encodes a VGAM112 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM112 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM112 precursor RNA is designated SEQ ID:98, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:98 is located at position 50148 relative to the genome of Vaccinia Virus.

[3188] VGAM112 precursor RNA folds onto itself, forming VGAM112 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[3189] An enzyme complex designated DICER COMPLEX, `dices` the VGAM112 folded precursor RNA into VGAM112 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 75%) nucleotide sequence of VGAM112 RNA is designated SEQ ID:447, and is provided hereinbelow with reference to the sequence listing part.

[3190] VGAM112 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM112 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM112 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[3191] VGAM112 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM112 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM112 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM112 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM112 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[3192] The complementary binding of VGAM112 RNA, herein designated VGAM RNA, to host target binding sites on VGAM112 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM112 host tar-

get RNA into VGAM112 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[3193] It is appreciated that VGAM112 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM112 host target genes. The mRNA of each one of this plurality of VGAM112 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM112 RNA, herein designated VGAM RNA, and which when bound by VGAM112 RNA causes inhibition of translation of respective one or more VGAM112 host target proteins.

[3194] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM112 gene, herein designated VGAM GENE, on one or more VGAM112 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[3195] It is yet further appreciated that a function of VGAM112 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM112 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM112 correlate with, and may be deduced from, the identity of the host target genes which VGAM112 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[3196] Nucleotide sequences of the VGAM112 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM112 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM112 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM112 are further

described hereinbelow with reference to Table 1.

[3197] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM112 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM112 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[3198] As mentioned hereinabove with reference to Fig. 1, a function of VGAM112 gene, herein designated VGAM is inhibition of expression of VGAM112 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM112 correlate with, and may be deduced from, the identity of the target genes which VGAM112 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[3199] KIAA1265 (Accession XM_047707) is a VGAM112 host target gene. KIAA1265 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1265, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1265 BINDING SITE,

designated SEQ ID:2896, to the nucleotide sequence of VGAM112 RNA, herein designated VGAM RNA, also designated SEQ ID:447.

[3200] A function of VGAM112 is therefore inhibition of KIAA1265 (Accession XM_047707). Accordingly, utilities of VGAM112 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1265. MGC2731 (Accession NM_024068) is another VGAM112 host target gene. MGC2731 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC2731, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC2731 BINDING SITE, designated SEQ ID:2050, to the nucleotide sequence of VGAM112 RNA, herein designated VGAM RNA, also designated SEQ ID:447.

[3201] Another function of VGAM112 is therefore inhibition of MGC2731 (Accession NM_024068). Accordingly, utilities of VGAM112 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC2731. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the

present invention, referred to here as Viral Genomic Address Messenger 113 (VGAM113) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[3202] VGAM113 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM113 was detected is described hereinabove with reference to Figs. 1–8.

[3203] VGAM113 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus. VGAM113 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[3204] VGAM113 gene encodes a VGAM113 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM113 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM113 precursor RNA is designated SEQ ID:99, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:99 is located at position 49143 relative to the genome of Vac–

cinia Virus.

[3205] VGAM113 precursor RNA folds onto itself, forming VGAM113 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[3206] An enzyme complex designated DICER COMPLEX, `dices` the VGAM113 folded precursor RNA into VGAM113 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of VGAM113 RNA is designated SEQ ID:448, and is provided hereinbelow with reference to the sequence listing part.

[3207] VGAM113 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM113 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM113 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[3208] VGAM113 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM113 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM113 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM113 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM113 host target RNA, herein designated VGAM HOST TARGET RNA. It is further

appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[3209] The complementary binding of VGAM113 RNA, herein designated VGAM RNA, to host target binding sites on VGAM113 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM113 host target RNA into VGAM113 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[3210] It is appreciated that VGAM113 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM113 host target genes. The mRNA of each one of this plurality of VGAM113 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM113 RNA, herein designated VGAM RNA, and which when bound by VGAM113 RNA causes inhibition of translation of respective one or more VGAM113 host target proteins.

[3211] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM113 gene, herein designated VGAM GENE, on one or more VGAM113 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[3212] It is yet further appreciated that a function of VGAM113 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM113 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM113 correlate

with, and may be deduced from, the identity of the host target genes which VGAM113 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[3213] Nucleotide sequences of the VGAM113 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM113 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM113 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM113 are further described hereinbelow with reference to Table 1.

[3214] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM113 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM113 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[3215] As mentioned hereinabove with reference to Fig. 1, a function of VGAM113 gene, herein designated VGAM is inhibition of expression of VGAM113 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM113 correlate with, and may be deduced

from, the identity of the target genes which VGAM113 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[3216] Complement Component 3a Receptor 1 (C3AR1, Accession NM_004054) is a VGAM113 host target gene. C3AR1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C3AR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C3AR1 BINDING SITE, designated SEQ ID:1081, to the nucleotide sequence of VGAM113 RNA, herein designated VGAM RNA, also designated SEQ ID:448.

[3217] A function of VGAM113 is therefore inhibition of Complement Component 3a Receptor 1 (C3AR1, Accession NM_004054). Accordingly, utilities of VGAM113 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C3AR1. GABA(A) Receptors Associated Protein Like 3 (GABARAPL3, Accession NM_032568) is another VGAM113 host target gene. GABARAPL3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GABARAPL3, corresponding to a HOST TARGET binding

site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GABARAPL3 BINDING SITE, designated SEQ ID:2260, to the nucleotide sequence of VGAM113 RNA, herein designated VGAM RNA, also designated SEQ ID:448.

[3218] Another function of VGAM113 is therefore inhibition of GABA(A) Receptors Associated Protein Like 3 (GABARAPL3, Accession NM_032568). Accordingly, utilities of VGAM113 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GABARAPL3. Golgi Autoantigen, Golgin Subfamily A, 2-like, Y-linked (GOLGA2LY, Accession XM_034789) is another VGAM113 host target gene. GOLGA2LY BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by GOLGA2LY, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GOLGA2LY BINDING SITE, designated SEQ ID:2684, to the nucleotide sequence of VGAM113 RNA, herein designated VGAM RNA, also designated SEQ ID:448.

[3219] Another function of VGAM113 is therefore inhibition of

Golgi Autoantigen, Golgin Subfamily A, 2-like, Y-linked (GOLGA2LY, Accession XM_034789). Accordingly, utilities of VGAM113 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GOLGA2LY. Paternally Expressed 10 (PEG10, Accession NM_015068) is another VGAM113 host target gene. PEG10 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PEG10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PEG10 BINDING SITE, designated SEQ ID:1607, to the nucleotide sequence of VGAM113 RNA, herein designated VGAM RNA, also designated SEQ ID:448.

[3220] Another function of VGAM113 is therefore inhibition of Paternally Expressed 10 (PEG10, Accession NM_015068). Accordingly, utilities of VGAM113 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PEG10. Ring Finger Protein 13 (RNF13, Accession NM_007282) is another VGAM113 host target gene. RNF13 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RNF13, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RNF13 BINDING SITE, designated SEQ ID:1376, to the nucleotide sequence of VGAM113 RNA, herein designated VGAM RNA, also designated SEQ ID:448.

[3221] Another function of VGAM113 is therefore inhibition of Ring Finger Protein 13 (RNF13, Accession NM_007282). Accordingly, utilities of VGAM113 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RNF13. LOC143692 (Accession XM_084601) is another VGAM113 host target gene. LOC143692 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC143692, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC143692 BINDING SITE, designated SEQ ID:3060, to the nucleotide sequence of VGAM113 RNA, herein designated VGAM RNA, also designated SEQ ID:448.

[3222] Another function of VGAM113 is therefore inhibition of LOC143692 (Accession XM_084601). Accordingly, utilities

of VGAM113 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC143692. LOC151201 (Accession XM_098021) is another VGAM113 host target gene. LOC151201 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC151201, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151201 BINDING SITE, designated SEQ ID:3342, to the nucleotide sequence of VGAM113 RNA, herein designated VGAM RNA, also designated SEQ ID:448.

[3223] Another function of VGAM113 is therefore inhibition of LOC151201 (Accession XM_098021). Accordingly, utilities of VGAM113 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151201. LOC257431 (Accession XM_088764) is another VGAM113 host target gene. LOC257431 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC257431, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC257431 BINDING SITE, designated SEQ ID:3231, to the nucleotide sequence of VGAM113 RNA, herein designated VGAM RNA, also designated SEQ ID:448.

[3224] Another function of VGAM113 is therefore inhibition of LOC257431 (Accession XM_088764). Accordingly, utilities of VGAM113 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257431. LOC93259 (Accession XM_050105) is another VGAM113 host target gene. LOC93259 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC93259, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC93259 BINDING SITE, designated SEQ ID:2927, to the nucleotide sequence of VGAM113 RNA, herein designated VGAM RNA, also designated SEQ ID:448.

[3225] Another function of VGAM113 is therefore inhibition of LOC93259 (Accession XM_050105). Accordingly, utilities of VGAM113 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC93259. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the

present invention, referred to here as Viral Genomic Address Messenger 114 (VGAM114) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[3226] VGAM114 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM114 was detected is described hereinabove with reference to Figs. 1–8.

[3227] VGAM114 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM114 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[3228] VGAM114 gene encodes a VGAM114 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM114 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM114 precursor RNA is designated SEQ ID:100, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:100 is located at position 49722 relative to the genome of Vac–

cinia Virus.

[3229] VGAM114 precursor RNA folds onto itself, forming VGAM114 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[3230] An enzyme complex designated DICER COMPLEX, `dices` the VGAM114 folded precursor RNA into VGAM114 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 74%) nucleotide sequence of VGAM114 RNA is designated SEQ ID:449, and is provided hereinbelow with reference to the sequence listing part.

[3231] VGAM114 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM114 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM114 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[3232] VGAM114 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM114 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM114 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM114 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM114 host target RNA, herein designated VGAM HOST TARGET RNA. It is further

appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[3233] The complementary binding of VGAM114 RNA, herein designated VGAM RNA, to host target binding sites on VGAM114 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM114 host target RNA into VGAM114 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[3234] It is appreciated that VGAM114 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM114 host target genes. The mRNA of each one of this plurality of VGAM114 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM114 RNA, herein designated VGAM RNA, and which when bound by VGAM114 RNA causes inhibition of translation of respective one or more VGAM114 host target proteins.

[3235] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM114 gene, herein designated VGAM GENE, on one or more VGAM114 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[3236] It is yet further appreciated that a function of VGAM114 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM114 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM114 correlate

with, and may be deduced from, the identity of the host target genes which VGAM114 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.
